About This Guide

This manual will see you through your initial contact with openSUSE®. Check out the various parts of this manual to learn how to install, use and enjoy your system.

Installation and Setup

Guides you through the installation process and the basic configuration of your system. Introduces YaST, the central tool for installation and configuration of your system. Learn how to set up or modify key components of your system: hardware components such as monitors or printers and network connections such as Internet access. Find how to install or remove software, how to administer users and groups, and how to make use of the various system languages available with openSUSE.

Basics

This part mainly addresses to users changing to Linux from other operating systems. It introduces basic Linux concepts such as the user concept, the structure of the file system and access permissions for files and directories. An introduction to the shell is also provided, although you hardly ever need the command line to interact with your system nowadays.

Mobility

Get an overview of the features openSUSE offers to support mobile working with laptops, mobile storage devices such as external hard disks and PDAs or cellular phones. Learn how to use NetworkManager to easily integrate your machine into different network environments or different types of networks. Find advice on how to exchange files between different systems, be it on different partitions of one computer (Linux/Windows*), or from one computer to another (Linux/Linux, Linux/Windows).

Help and Troubleshooting

Provides an overview of where to find help and additional documentation in case you need more information or want to perform specific tasks with your system. Also find a compilation of the most frequent problems and annoyances and learn how to solve these problems on your own.

Many chapters in this manual contain links to additional documentation resources. This includes documentation that is available on the system as well as documentation available on the Internet.

For an overview of the documentation available for your product and the latest documentation updates, refer to <http://www.novell.com/documentation/opensuse111> or to the following section.

1 Available Documentation

We provide HTML and PDF versions of our books in different languages. The following manuals for users and administrators are available on this product:

Start-Up (page 1)

Guides you through the installation and basic configuration of your system. For newcomers, the manual also introduces basic Linux concepts such as the file system, the user concept and access permissions and gives an overview of the features openSUSE offers to support mobile computing. Provides help and advice in troubleshooting.

KDE User Guide (↑KDE User Guide)

Introduces the KDE desktop of openSUSE. It guides you through using and configuring the desktop and helps you perform key tasks. It is intended mainly for users who want to make efficient use of KDE as their default desktop.

GNOME User Guide (↑GNOME User Guide)

Introduces the GNOME desktop of openSUSE. It guides you through using and configuring the desktop and helps you perform key tasks. It is intended mainly for end users who want to make efficient use of GNOME desktop as their default desktop.

Application Guide (↑Application Guide)

Learn how to use and configure key desktop applications on openSUSE. This guide introduces browsers and e-mail clients as well as office applications and collaboration tools. It also covers graphics and multimedia applications.

Reference (↑Reference)

Gives you a general understanding of openSUSE and covers advanced system administration tasks. It is intended mainly for system administrators and home users with basic system administration knowledge. It provides detailed information about advanced deployment scenarios, administration of your system, the interaction of key system components and the set-up of various network and file services openSUSE offers.

Novell AppArmor Administration Guide (↑Novell AppArmor Administration Guide)

Contains in-depth information about the use of Novell AppArmor in your environment. AppArmor is a security application that lets you specify per program which files the program may read, write, and execute.

Lessons For Lizards

A community book project for the openSUSE distribution. A snapshot of the manual written by the open source community is released on an equal footing with the Novell/SUSE manuals. The lessons are written in a cook book style and cover more specific or exotic topics than the traditional manuals. For more information, see http://developer.novell.com/wiki/index.php/Lessons_for_Lizards.

In addition to the comprehensive manuals, several quick start guides are available:

KDE Quick Start (↑)

Gives a short introduction to the KDE desktop and some key applications running on it.

GNOME Quick Start (↑)

Gives a short introduction to the GNOME desktop and some key applications running on it.

Novell AppArmor Quick Start

Helps you understand the main concepts behind Novell® AppArmor.

Find HTML versions of most openSUSE manuals in your installed system under `/usr/share/doc/manual` or in the help centers of your desktop. Find the latest documentation updates at <http://www.novell.com/documentation> where you can download PDF or HTML versions of the manuals for your product.

For information where to find the books on your installation media, refer to the Release Notes of this product. The Release Notes are available from your installed system under `/usr/share/doc/release-notes/` or in the help centers of your KDE or GNOME desktop.

2 Feedback

Several feedback channels are available:

- To report bugs for a product component or to submit enhancements requests, please use <https://bugzilla.novell.com/>. If you are new to Bugzilla, you might find the *Submitting Bug Reports* article—available under http://en.opensuse.org/Submitting_Bug_Reports helpful. Frequently asked questions on reporting bugs are available under http://en.opensuse.org/Bug_Reporting_FAQ.
- We want to hear your comments and suggestions about this manual and the other documentation included with this product. Please use the User Comments feature at the bottom of each page of the online documentation and enter your comments there.

3 Documentation Conventions

The following typographical conventions are used in this manual:

- `/etc/passwd`: filenames and directory names
- *placeholder*: replace *placeholder* with the actual value
- `PATH`: the environment variable `PATH`
- `ls, --help`: commands, options, and parameters
- `user`: users or groups
- `Alt, Alt + F1`: a key to press or a key combination; keys are shown in uppercase as on a keyboard
- *File, File > Save As*: menu items, buttons
- *Dancing Penguins* (Chapter *Penguins*, ↑Another Manual): This is a reference to a chapter in another manual.

4 About the Making of This Manual

This book is written in Novdoc, a subset of DocBook (see <http://www.docbook.org>). The XML source files were validated by `xmllint`, processed by `xsltproc`, and converted into XSL-FO using a customized version of Norman Walsh's stylesheets. The final PDF is formatted through XEP from RenderX.

5 Source Code

The source code of openSUSE is publicly available. To download the source code, proceed as outlined under http://www.novell.com/products/suselinux/source_code.html. If requested we send you the source code on a DVD. We need to charge a \$15 or €15 fee for creation, handling and postage. To request a DVD of the source code, send an e-mail to sourcedvd@suse.de [<mailto:sourcedvd@suse.de>] or mail the request to:

SUSE Linux Products GmbH Product Management openSUSE Maxfeldstr. 5 D-90409
Nürnberg Germany

6 Acknowledgments

With a lot of voluntary commitment, the developers of Linux cooperate on a global scale to promote the development of Linux. We thank them for their efforts—this distribution would not exist without them. Furthermore, we thank Frank Zappa and Pawar. Special thanks, of course, goes to Linus Torvalds.

Have a lot of fun!

Your SUSE Team

Part I. Installation and Setup

Installation with YaST

Install your openSUSE® system with YaST, the central tool for installation and configuration of your system. YaST guides you through the installation process and the basic configuration of your system. During the installation and configuration process, YaST analyzes both your current system settings and your hardware components and proposes installation settings based on this analysis. By default, YaST displays an overview of all installation steps on the left hand side of the window and provides online help texts for each step. Click *Help* to view the help text.

If you are a first-time user of openSUSE, you might want to follow the default YaST proposals in most parts, but you can also adjust the settings as described here to fine-tune your system according to your needs and wishes. Many parts of the basic system configuration, such as user accounts or system language, can also be modified after the installation process.

1.1 Choosing the Installation Media

When installing openSUSE, choose from several media available either online or in the retail box:

DVD-retail

One DVD containing the openSUSE distribution with open source software (OSS) as well as non-open source software (non-OSS) for 32bit and 64bit systems. In German retail boxes an additional second DVD contains six hours of video-training covering openSUSE 11.1, OpenOffice and GIMP.

This installation option does not require any network access for installation, nor do you need to set up external repositories to install the full openSUSE. You can, however, make the contents of the DVD available on an installation server and make them available all across your network.

DVD-download

One DVD5, available via download, containing OSS and non-OSS software either for 32bit or 64bit systems.

Choose this installation option, if you want a fully-fledged openSUSE system. Beyond the downloading of the DVD ISO, there is no network connection required to make use of this installation option. Once the medium has been fully downloaded and the physical medium created, you can go ahead with the installation. You can also make the contents of the DVDs available on an installation server and make them available all across your network.

KDE4/GNOME LiveCD

The LiveCD versions, available via download, include the KDE4 or GNOME desktops together with the most popular applications for 32-bit or 64-bit systems.

Choose this medium option for a first look at openSUSE. The LiveCD version runs on your computer using RAM without touching your hard drive and no installation is needed. However, you can also install openSUSE from the running live system. There is no network connection required beyond the mere download of the medium.

NOTE: Installing From a LiveCD

In order to install from a LiveCD, boot the live system from CD. In the running system, launch the installation routine by clicking on the *Install* icon on the desktop. Phase one of the installation will be carried out in a window on the desktop. It is not possible to update or repair an existing system with a LiveCD, you can only perform a new installation with automatic configuration.

Mini CD

The Mini CD contains a minimal Linux system needed to run the installation. The installation system itself and the installation data are loaded from a network source. To install from a network providing SLP, please start the installation as described in [Section 1.2.1, “Installing from a Network Server Using SLP”](#) (page 7). To install

from a HTTP, FTP, NFS, or SMB server, follow the instructions in [Section 1.2.2, “Installing from a Network Source without SLP”](#) (page 7).

IMPORTANT: Add-On CDs—Installing Additional Software

Although add-on CDs (extensions or third-party products) cannot be used as stand-alone installation media, they can be embedded as additional software sources during the installation. Currently CDs with additional languages are available as add-on CDs for openSUSE.

1.2 Choosing the Installation Method

After having selected the installation medium, determine a suitable installation method and boot option that best match your needs:

Installing from the openSUSE Media

Choose this option, if you want to perform a stand-alone installation and do not want to rely on a network providing the installation data or the boot infrastructure. The installation proceeds exactly as outlined in [Section 1.3, “The Installation Workflow”](#) (page 8).

Installing from a Network Server

Choose this option, if you have an installation server available in your network or want to use an external server as the source of your installation data. This setup can be configured to use from physical media (Floppy, CD/DVD, or hard disk) for booting or configured to boot via network using PXE/BOOTP. Refer to [Section 1.2.1, “Installing from a Network Server Using SLP”](#) (page 7), [Section 1.2.2, “Installing from a Network Source without SLP”](#) (page 7), or Chapter 1, *Remote Installation* (↑Reference) for details.

Installing with `instlux` from Windows

Choose this installation option, if you prefer a smooth transition from using Windows to Linux. `instlux` allows you to boot into the openSUSE installation right from a running Windows by modifying the Windows boot loader. This installation option is only available from the DVD media. Refer to [Section 1.2.3, “Installing with `instlux` from Windows”](#) (page 7) for details.

openSUSE supports several different boot options from which you can choose depending on the hardware available and on the installation scenario you prefer. Booting from the openSUSE media or using `instlpx` are the most straightforward options, but special requirements might call for special setups:

Table 1.1 *Boot Options*

Boot Option	Description
DVD/CD-ROM	This is the easiest boot option. This option can be used if the system has a local CD-ROM drive that is supported by Linux.
<code>instlpx</code>	<code>instlpx</code> is installed under Microsoft Windows* and makes it possible to boot directly into the installation
Floppy	The data for generating boot floppies are located on DVD 1 in the <code>/boot/architecture/</code> directory. A <code>README</code> with instructions on how to create the boot floppies is available in the same directory.
PXE or BOOTP	Booting over the network must be supported by the system's BIOS or firmware and a boot server must be available in the network. This task can also be handled by another openSUSE system. See http://en.opensuse.org/SuSE_install_with_PXE_boot for more information. Refer to Chapter 1, <i>Remote Installation</i> (↑Reference) for more information.
Hard Disk	openSUSE installation can also be booted from the hard disk. To do this, copy the kernel (<code>linux</code>) and the installation system (<code>initrd</code>) from the directory <code>/boot/architecture/loader</code> on the installation media to the hard disk and add an appropriate entry to the existing boot loader of a previous openSUSE installation.

1.2.1 Installing from a Network Server Using SLP

If your network setup supports OpenSLP and your network installation source has been configured to announce itself via SLP (described in Section “Setting Up the Server Holding the Installation Sources” (Chapter 1, *Remote Installation*, ↑Reference)), boot the system, press F4 in the boot screen and select *SLP* from the menu.

The installation program configures the network connection with DHCP and retrieves the location of the network installation source from the OpenSLP server. If the automatic DHCP network configuration fails, you are prompted to enter the appropriate parameters manually. The installation then proceeds as described below with the exception of the network configuration step needed prior to adding additional repositories. This step is not needed as the network is already configured and active at this point.

1.2.2 Installing from a Network Source without SLP

If your network setup does not support OpenSLP for the retrieval of network installation sources, boot the system and press F4 in the boot screen to select the desired network protocol (NFS, HTTP, FTP, or SMB/CIFS). Provide the server's address and the path to the installation media.

The installation program automatically configures the network connection with DHCP. If this configuration fails, you are prompted to enter the appropriate parameters manually. The installation retrieves the installation data from the source specified. The installation then proceeds as described below with the exception of the network configuration step needed prior to adding additional repositories. This step is not needed as the network is already configured and active at this point.

1.2.3 Installing with `instlux` from Windows

`instlux` is a Microsoft Windows* application that prepares your computer to directly boot into the openSUSE installation without having to adjust BIOS settings. `instlux` is only available on DVD media. To use `instlux`, insert the openSUSE media under Windows. The openSUSE 11.1 `Installer` setup automatically starts. Choose a language

for the installation and follow the instructions on the screen. The language you choose here is also preconfigured to be used for the openSUSE installation.

On the next reboot, the Microsoft Windows boot loader launches. Choose openSUSE 11.1 *Installer* to start the openSUSE installation. In order to proceed with the installation, you will be prompted to insert the installation media. The installation proceeds as described below. When Microsoft Windows is booted again, `instluxe` is automatically uninstalled.

TIP: Installing openSUSE alongside Microsoft Windows

openSUSE can easily be installed alongside Microsoft Windows. Carry out the installation as described below—an existing Windows installation will automatically be detected and a dual boot option will be installed. If Windows covers the whole installation disk, the installation routine will make a reasonable proposal to shrink an existing Windows partition in order to make room for the openSUSE. Please read [Section “Resizing a Windows Partition”](#) (page 19) prior to the installation for detailed information.

1.3 The Installation Workflow

The openSUSE installation is split into three main parts: preparation, installation, configuration. During the preparation phase you configure some basic parameters such as language, time, desktop type, users, passwords, hard disk setup and installation scope. In the non-interactive installation phase the software is installed and the system is prepared for the first boot. Upon finishing the installation the machine reboots into the newly installed system and starts the final system configuration. You can choose whether to do a fully automatic or a manual configuration. In this stage, network and Internet access, as well as hardware components such as printers, are set up.

1.4 System Start-Up for Installation

You can install openSUSE from local installation sources, such as the openSUSE CDs or DVD, or from network source of an FTP, HTTP, NFS, or SMB server. Any of these approaches requires physical access to the system to install and user interaction during the installation. The installation procedure is basically the same regardless of the instal-

lation source. Any exceptions are sufficiently highlighted in the following workflow description.

1.5 The Boot Screen

The boot screen displays a number of options for the installation procedure. *Boot from Hard Disk* boots the installed system and is selected default, because the CD is often left in the drive. Select one of the other options with the arrow keys and press Enter to boot it. The relevant options are:

Installation

The normal installation mode. All modern hardware functions are enabled. In case the installation fails, see [F5Kernel](#) (page 11) for boot options that disable potentially problematic functions.

Repair Installed System

Boots into the graphical repair system. More information on repairing an installed system is available in [Section 13.6.3, “Recovering a Corrupted System”](#) (page 227). This option is not available when installing from CD.

Rescue System

Starts a minimal Linux system without a graphical user interface. For more information, see [Section “Using the Rescue System”](#) (page 232).

Check Installation Media

This option is only available when you install from media created from downloaded ISOs. In this case it is recommended to check the integrity of the installation medium. This option starts the installation system before automatically checking the media. In case the check was successful, the normal installation routine starts. If a corrupt media is detected, the installation routine aborts.

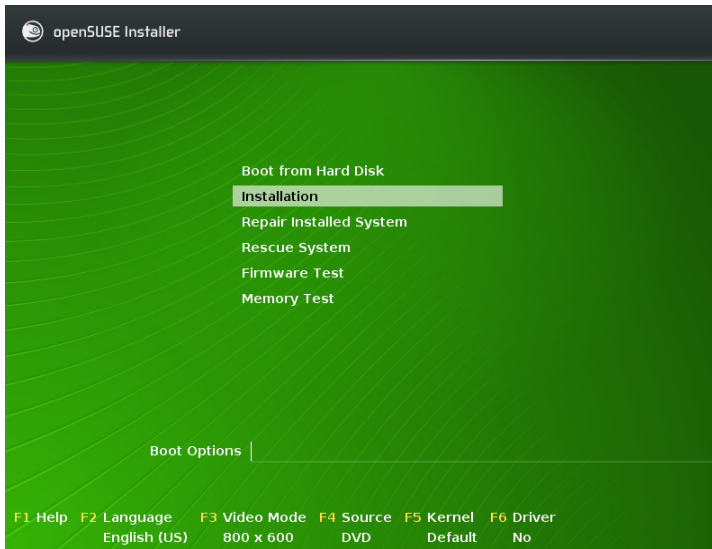

Firmware Test

Starts a BIOS checker that validates ACPI and other parts of your BIOS. This option is not available with the CD-KDE and CD-GNOME media.

Memory Test

Tests your system RAM using repeated read and write cycles. Terminate the test by rebooting. For more information, see [Section 13.2.5, “Fails to Boot”](#) (page 206). This option is not available with the CD-KDE and CD-GNOME media.

Figure 1.1 *The Boot Screen*

Use the function keys indicated in the bar at the bottom of the screen to change the language, screen resolution, installation source or to add additional driver from your hardware vendor:

F1 Help

Get context-sensitive help for the active element of the boot screen. Use the arrow keys to navigate, **Enter** to follow a link, and **Esc** to leave the help screen.

F2 Language

Select the display language and a corresponding keyboard layout for the installation. The default language is English (US).

F3 Video Mode

Select various graphical display modes for the installation. Select *Text Mode* if the graphical installation causes problems.

F4 Source

Normally, the installation is performed from the inserted installation medium. Here, select other sources, like FTP or NFS servers. If the installation is carried out in a network with an SLP server, select one of the installation sources available on the

server with this option. Find information about SLP in Chapter 21, *SLP Services in the Network* (↑Reference).

F5Kernel

In case you encounter problems with the regular installation, this menu offers to disable a few potentially problematic functions. If your hardware does not support ACPI (advanced configuration and power interface) select *No ACPI* to install without ACPI support. *No local APIC* disables support for APIC (Advanced Programmable Interrupt Controllers) which may cause problems with some hardware. *Safe Settings* boots the system with the DMA mode (for CD/DVD-ROM drives) and power management functions disabled.

If you are not sure, try the following options first: *Installation—ACPI Disabled* or *Installation—Safe Settings*. Experts can also use the command line (*Boot Options*) to enter or change kernel parameters.

F6Driver

Press this key to tell the system that you have an optional driver update for openSUSE. With *File* or *URL*, load drivers directly before the installation starts. If you select *Yes*, you are prompted to insert the update disk at the appropriate point in the installation process.

F7Arch

If you install from an installation medium supporting 32bit and 64bit architectures and have an AMD or Intel processor with 64-bit support, select whether to install a 64-bit or 32-bit system. By default, a 64-bit system is installed on a computer with 64-bit support. To install a 32-bit system, press F7 then select *32bit*.

After starting the installation, openSUSE loads and configures a minimal Linux system to run the installation procedure. To view the boot messages and copyright notices during this process, press Esc. On completion of this process, the YaST installation program starts and displays the graphical installer.

TIP: Installation without a Mouse

If the installer does not detect your mouse correctly, use Tab for navigation, arrow keys to scroll, and Enter to confirm a selection. Various buttons or selection fields contain a letter with an underscore. Use Alt + Letter to select a button or a selection directly instead of navigating there with Tab.

1.6 Welcome

Start the installation of openSUSE by choosing your language. Changing the language will automatically preselect a corresponding keyboard layout. Override this proposal by selecting a different keyboard layout from the drop-down menu. The language selected here is also used to assume a time zone for the system clock. This setting—along with the selection of secondary languages to install on your system—can be modified later during the installation.

You can also change the language subsequently in the *Installation Summary*, described in [Section 1.12, “Installation Settings”](#) (page 25). For information about language settings in the installed system, see [Chapter 6, *Changing Language and Country Settings with YaST*](#) (page 79).

Read the license agreement that is displayed beneath the language and keyboard selection thoroughly. Use *License Translations...* to display the license agreement full-screen for a better readability and to access translations. If you agree to the terms, check *I Agree to the License Terms* and click *Next* to proceed with the installation. If you do not agree to the license agreement, you cannot install openSUSE. Click *Abort* to terminate the installation.

Figure 1.2 Welcome

1.7 Installation Mode

After a system analysis where YaST probes for storage devices and tries to find other installed systems on your machine, the installation modes available are displayed. This step is skipped when installing from a LiveCD, since this medium only supports a new installation with automatic configuration.

New installation

Select this option to start a new installation from scratch.

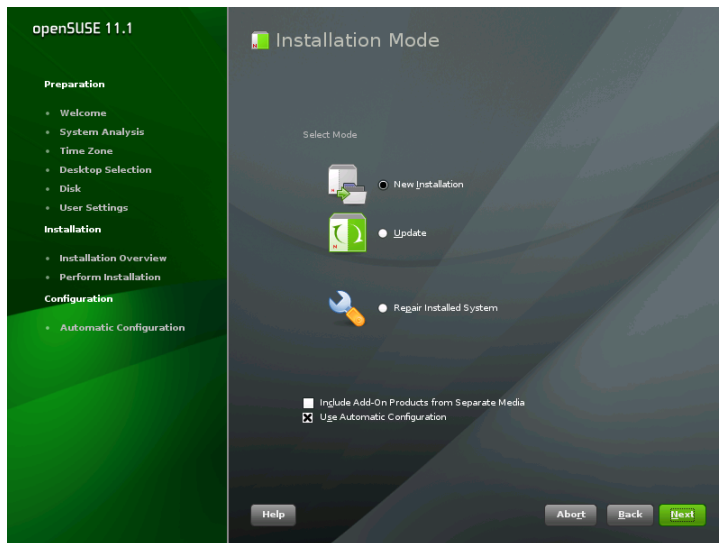

Update

Select this option to update to a newer version. For more information about system updates, see Chapter 12, *Updating the System and System Changes* (↑Reference).

Repair Installed System

Choose this option to repair a damaged system that is already installed. More information is available in [Section 13.6.3, “Recovering a Corrupted System”](#) (page 227).

Figure 1.3 *Installation Mode*

By default, the *Automatic Configuration* is used when performing a new installation. In this mode the system automatically configures your hardware and the network, so

the installation is performed with minimal user interaction. If necessary, you can change every configuration that is set up later in the installed system using YaST. In repair mode the automatic configuration attempts to fix errors automatically. Uncheck *Use Automatic Configuration* if you prefer a manual configuration during the installation or to start the system repair in expert mode.

This screen also offers to include add-on products during the installation. To include such products, check *Install Add-On Products from Separate Media*. An add-on product can include extensions, third-party products or additional software for your system such as support for additional languages.

Click *Next* to proceed. If you selected to include an add-on product, proceed with [Section 1.7.1, “Add-On Products”](#) (page 14), otherwise skip the next section and advance to [Section 1.8, “Clock and Time Zone”](#) (page 15).

1.7.1 Add-On Products

Add-on products can be installed either from a local source (CD, DVD, or directory) or from a network source (HTTP, FTP, NFS, CIFS,...). When installing from a network source, you need to configure the network first—unless you are performing a network installation anyway. Choose *Yes, Run the Network Setup* and proceed as described in [Section “Network Setup”](#) (page 15). If the add-on product is available locally, select *No, Skip the Network Setup*.

Click *Next* and specify the product source. Source types available are *CD, DVD, Hard Disk, USB Stick or Disk, a Local Directory* or a *Local ISO Image*, if no network was configured. If the add-on product is available on removable media, the system automatically mounts the media and reads its contents. If the add-on product is available on hard disk, choose *Hard Disk* to install from an unmounted hard drive, or *Local Directory/Local ISO Image* if it is located in the file system. Add-on products may be delivered as a repository or as a set of rpm files. In the latter case, check *Plain RPM Directory*. While a network is available, you can choose from additional remote sources such as HTTP, SLP, FTP and others. It is also possible to specify a URL directly.

Check *Download Repository Description Files* to download the files describing the repository now. If unchecked, they will be downloaded once the installation starts. Proceed with *Next* and insert a CD or DVD if required. Depending on the product's content it may be necessary to accept additional license agreements.

It is also possible to configure add-on products at any time in the installed systems. Using add-on products in the installed system is described in Chapter 6, *Installing Add-On Products* (↑Reference).

Network Setup

When invoking the network setup, YaST scans for available network cards. If more than one network card is found, you have to choose the card to configure from the list.

If an ethernet network adapter is not already connected, a warning will open. Make sure the network cable is plugged in and choose *Yes, Use It*. In the following dialog the actual network configuration is done. If your network is equipped with a DHCP server, choose *Automatic Address Setup (via DHCP)*. To manually set up the network choose *Static Address Setup* and specify *IP Address*, *Netmask*, *Default Gateway IP*, and the *DNS Server IP*.

Some networks require the use of a proxy server to access the Internet. Tick the check box *Use Proxy for Accessing the Internet* and enter the appropriate specifications. Click *Accept* to perform the network setup. The installation procedure will continue with the add-on products or repositories setup as described in [Section 1.7.1, “Add-On Products”](#) (page 14).

1.8 Clock and Time Zone

In this dialog, select your region and time zone. Both are preselected according to the selected installation language. To change the preselected values, either use the map or the drop down lists for *Region* and *Time Zone*. When using the map, point the cursor at the rough direction of your region and left-click to zoom. Now choose your country or region by left-clicking. Right-click to return to the world map.

Figure 1.4 *Clock and Time Zone*

To set up the clock, choose whether the *Hardware Clock is Set to UTC*. If you run another operating system on your machine, such as Microsoft Windows*, it is likely your system uses local time instead. If you only run Linux on your machine, set the hardware clock to UTC and have the switch from standard time to daylight saving time performed automatically.

If a network is already configured, the time is automatically synced via Network Time Protocol (NTP) with the openSUSE time server (opensuse.pool.ntp.org). Click *Change* to either alter the NTP settings or to *Manually* set the time. See Chapter 24, *Time Synchronization with NTP* (↑Reference) for more information on configuring the NTP service. When finished, click *Accept* to continue the installation.

1.9 Desktop Selection

In openSUSE, you can choose from various desktops (this dialog is not available when installing from the CD-KDE or CD-GNOME). The major ones, *KDE 4.x* and *GNOME*, are powerful graphical desktop environments similar to Windows*. Find information about these in the KDE User Guide (↑KDE User Guide) and the GNOME User Guide

(↑GNOME User Guide). This step is skipped when installing from a LiveCD, since this medium is already preconfigured to either use KDE 4 or GNOME.

If you prefer a different desktop, choose *Other* for more options. *KDE 3.5.x* is the predecessor of the KDE 4 desktop and is still widely used. The *XFCE Desktop* is a fast and lightweight desktop environment suitable for modest hardware. With *Minimal X Window*, install a graphical window manager that allows for running stand-alone X applications and console windows but does not provide the usual integrated desktop functionality. In *Minimal Server Selection (Text Mode)*, only console terminals are available.

Figure 1.5 Desktop Selection

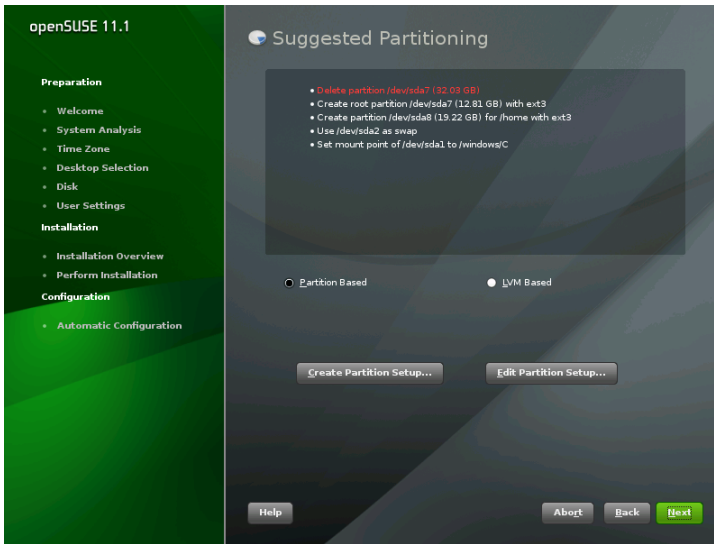

1.10 Suggested Partitioning

Define a partition setup for openSUSE in this step. In most cases, a reasonable scheme, that can be accepted without change, is proposed. If a hard disk only containing Windows FAT or NTFS partitions is selected as the installation target, YaST proposes to shrink one of these partitions. Accept the proposal with *Next* and proceed with the installation. Experienced users can also customize the proposal or apply their own partitioning scheme.

The proposed partitioning is *Partition Based* by default. If you prefer an *LVM Based* setup, check the respective option to automatically convert the proposal. Refer to Section “LVM Configuration” (Chapter 2, *Advanced Disk Setup*, ↑Reference) for more information about the Logical Volume Manager (LVM).

To make small changes in the proposal—like changing the file system type or encrypt partitions—, select *Edit Partition Setup* and adjust the settings. See Section “Using the YaST Partitioner” (Chapter 2, *Advanced Disk Setup*, ↑Reference) for instructions.

Figure 1.6 *Suggested Partitioning*

1.10.1 Partitioning a Specific Disk

If your machine contains more than one hard disk and you want to restrict the partitioning proposal to just one disk, choose *Create Partition Setup* and then select a specific disk from the list. If the chosen hard disk does not contain any partitions, yet, the whole hard disk will be used for the proposal, otherwise, you can choose which existing partition(s) to utilize. To add a separate partition for you personal data check *Propose a Separate Home Partition*. Instead of the default partition based proposal it is possible to *Create an LVM Based Proposal*. Choose two times *Next* to proceed to the next step.

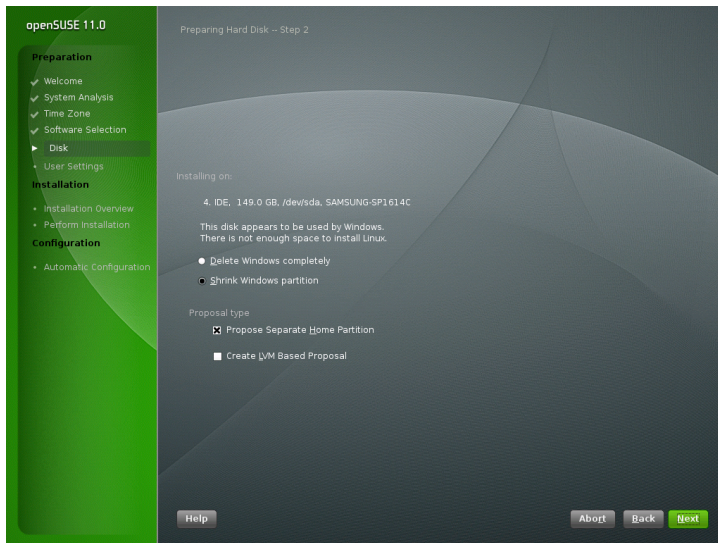

Resizing a Windows Partition

If the selected hard disk only contains a Windows FAT or NTFS partition, YaST offers to delete or shrink this partition. If you select *Delete Windows Completely*, the Windows partition is marked for deletion and the space is used for the installation of openSUSE.

WARNING: Deleting Windows

If you delete Windows, all data will be lost beyond recovery as soon as the formatting starts.

Figure 1.7 Possible Options for Windows Partitions

To *Shrink the Windows Partition*, you need to interrupt the installation and boot Windows to prepare the partition before shrinking it. For all Windows file systems, proceed as follows:

1. Deactivate a `Virtual Memory` file, if there is one.
2. Run `scandisk`.
3. Run `defrag`.

After these preparations, restart the openSUSE installation. When you turn to the partitioning setup, proceed as before and select *Shrink Windows Partition*. After a quick check of the partition, the dialog for resizing the Windows partition opens.

The bar graph shows how much disk space is currently occupied by Windows and how much space is still available. To change the proposed settings use the slider or the input fields to adjust the partition sizing.

Figure 1.8 *Resizing the Windows Partition*

If you leave this dialog by selecting *OK*, the settings are stored and you are returned to the previous dialog. The actual resizing takes place later, before the hard disk is formatted.

IMPORTANT: Writing on NTFS Partitions

By default, the Windows versions NT, 2000, and XP use the NTFS file system. openSUSE includes read and write access to the NTFS file system, but this feature has a few limitations. This means that you cannot read or write encrypted or compressed files. Furthermore, the Windows file permissions are not honored at the moment. See <http://en.opensuse.org/NTFS> for more information.

1.10.2 Custom Partitioning

Set up your own partitioning scheme by selecting *Create Partition Setup* and then *Custom Partitioning*. The Expert Partitioner opens displaying the current partition setup. Expand the *Hard Disks* in the System View pane by clicking on the +, then click on

one of the listed hard disks. Now you can *Add*, *Edit*, *Resize*, or *Delete* partitions. For more information about custom partitioning and configuring advanced features, refer to Section “Using the YaST Partitioner” (Chapter 2, *Advanced Disk Setup*, ↑Reference)

1.11 Create New User

Create a local user in this step. Administrating local users is a suitable option for stand-alone workstations. If setting up a client on a network with centralized user authentication, click *Change* and proceed with the [Section 1.11.1, “Expert Settings”](#) (page 23).

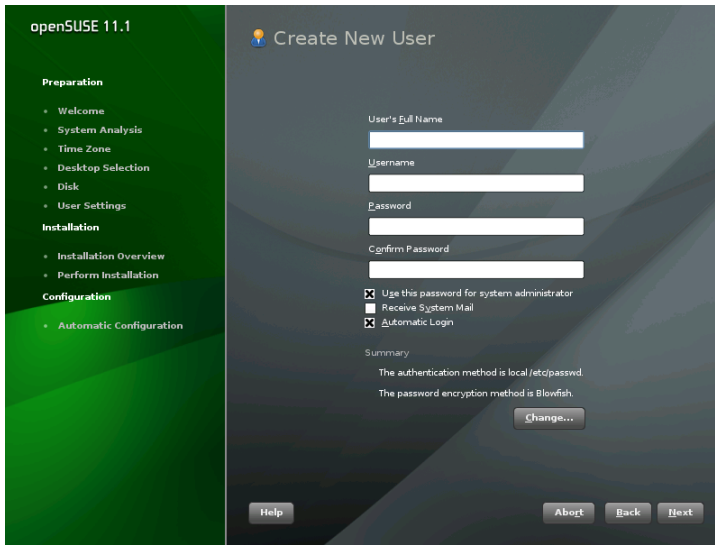

After entering the first name and last name, either accept the proposal or specify a new *Username* that will be used to log in. Finally, enter a password for the user. Reenter it for confirmation (to ensure that you did not type something else by mistake). To provide effective security, a password should be between five and eight characters long. The maximum length for a password is 72 characters. Passwords are case-sensitive. Special characters (7-bit ASCII) and the digits 0 to 9 are allowed. Other special characters like umlauts or accented characters are not allowed.

Passwords you enter are checked for weakness. When entering a password that is easy to guess, such as a dictionary word or a name, you will see a warning. It is a good security practice to use strong passwords.

IMPORTANT: Username and Password

Remember both your username and the password because they are needed each time you log in to the system.

Figure 1.9 *Create New User*

Three additional options are available:

Use this Password for the System Administrator

If checked, the same password you have entered for the user will be used for the system administrator `root`. This option is suitable for stand-alone workstations or machines in a home network that are administrated by a single user. When not checked, you are prompted for a system administrator password in the next step of the installation workflow (see [Section 1.11.2, “Password for the System Administrator `root`”](#) (page 24)).

Receive System Mail

Checking this box sends messages created by the system services to the user. These are usually only sent to `root`, the system administrator. This option is useful for the most frequently used account, because it is highly recommended to log in as `root` only in special cases.

The mails sent by system services are stored in the local mailbox `/var/spool/mail/username`, where `username` is the login name of the selected user. To read e-mails after installation, you can use any e-mail client, for example KMail or Evolution.

Automatic Login

This option automatically logs the current user in to the system when it starts. This is mainly useful if the computer is operated by only one user.

WARNING: Automatic Login

With the automatic login enabled, the system boots straight into your desktop with no authentication at all. If you store sensitive data on your system, you should not enable this option if the computer can also be accessed by others.

1.11.1 Expert Settings

Click *Change* in the Create User dialog to set up network authentication or, if present, import users from a previous installation. Also change the password encryption type in this dialog.

You can also add additional user accounts or change the user authentication method in the installed system. For detailed information about user management, see [Chapter 5, *Managing Users with YaST*](#) (page 61).

The default authentication method is *Local (/etc/passwd)*. If a former version of openSUSE or another system using `/etc/passwd` is detected, you may import local users. To do so, check *Read User Data from a Previous Installation* and click *Choose*. In the next dialog, select the users to import and finish with *OK*.

Access to the following network authentication services can be configured:

LDAP

Users are administered centrally on an LDAP server for all systems in the network. More information is available in Section “Configuring an LDAP Client with YaST” (Chapter 26, *LDAP—A Directory Service*, ↑Reference).

NIS

Users are administered centrally on a NIS server for all systems in the network. See Section “Configuring NIS Clients” (Chapter 25, *Using NIS*, ↑Reference) for more information.

Windows Domain

SMB authentication is often used in mixed Linux and Windows networks. and .

Along with user administration via *LDAP* and *NIS*, you can use Kerberos authentication. To use it, select *Set Up Kerberos Authentication*.

NOTE: Content of the Authentication Menu

If you have chosen a custom package selection for installation, not all mentioned authentication methods may be displayed, because the required packages are not installed.

1.11.2 Password for the System Administrator `root`

If you have not chosen *Use this Password for the System Administrator* in the previous step, you will be prompted to enter a Password for the System Administrator `root`. Otherwise this configuration step is skipped.

`root` is the name of the superuser, the administrator of the system. Unlike regular users, who may or may not have permission to do certain things on the system, `root` has unlimited power to do anything: change the system configuration, install programs, and set up new hardware. If users forget their passwords or have other problems with the system, `root` can help. The `root` account should only be used for system administration, maintenance, and repair. Logging in as `root` for daily work is rather risky: a single mistake could lead to irretrievable loss of system files.

For verification purposes, the password for `root` must be entered twice. Do not forget the `root` password. Once entered, this password cannot be retrieved.

The `root` can be changed any time later in the installed system. To do so run YaST and start *Security and Users > User and Group Management*.

WARNING: The root User

The user `root` has all the permissions needed to make changes to the system. To carry out such tasks, the `root` password is required. You cannot carry out any administrative tasks without this password.

1.12 Installation Settings

On the last step before the real installation takes place, you can alter installation settings suggested by YaST and also review the settings you made so far. To modify the suggestions, either click *Change* and select the category to change or click on one of the headlines. After configuring any of the items presented in these dialogs, you are always returned to the Installation Settings window, which is updated accordingly.

Figure 1.10 *Installation Settings*

TIP: Restoring the Default Settings

You can reset all changes to the defaults by clicking *Change > Reset to Defaults*. YaST then shows the original proposal again.

1.12.1 Partitioning

Review and—if necessary—change the partition setup you configured earlier. Changing the partition setup opens the Expert Partitioner described in Section “Using the YaST Partitioner” (Chapter 2, *Advanced Disk Setup*, ↑Reference).

1.12.2 Booting

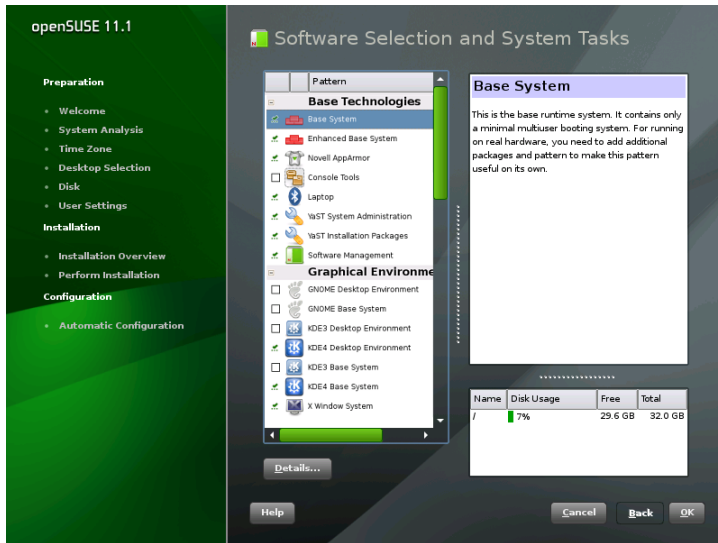

YaST proposes a boot configuration for your system. Other operating systems found on your computer, such as Microsoft Windows or other Linux installations, will automatically be detected and added to the boot loader. However, openSUSE will be booted by default. Normally, you can leave these settings unchanged. If you need a custom setup, modify the proposal for your system. For information, see Section “Configuring the Boot Loader with YaST” (Chapter 15, *The Boot Loader*, ↑Reference). The boot method should only be changed by experienced users.

1.12.3 Software

openSUSE contains a number of software patterns for various application purposes. Click *Software* to start the pattern selection and modify the installation scope according to your needs. Select your pattern from the list and see the software packages included in the right part of the window. Each pattern contains a number of software packages needed for specific functions (e.g. Multimedia or Office software). For a more detailed selection based on software packages to install, select *Details* to switch to the YaST Software Manager.

You can also install additional software packages or remove software packages from your system at any later time with the YaST Software Manager. For more information, refer to Chapter 3, *Installing or Removing Software* (↑Reference).

Figure 1.11 *Software Selection and System Tasks*

1.12.4 Locale Settings

Here you can change the system *Language* and *Keyboard Layout* you defined in the first step of the installation. It is also possible to add additional languages. To adjust the system language settings, select *Language*. Select a language from the list. The primary language is used as the system language. You can also adapt keyboard layout and time zone to the primary language if the current settings differ. *Details* lets you tune language settings for the user `root`, set UTF-8 support, or further specify the language (e.g. select South African English).

Choose secondary languages to be able to switch to one of these languages at any time without having to install additional packages. For more information, see [Chapter 6, Changing Language and Country Settings with YaST](#) (page 79).

To change the keyboard layout, select *Keyboard Layout*. By default, the layout corresponds to the language chosen for installation. Select the keyboard layout from the list. Use the *Test* field at the bottom of the dialog to check if you can enter special characters of that layout correctly. Options to fine-tune various settings are available under *Expert Mode*. Find more information about changing the keyboard layout in [Section 2.3,](#)

“[Setting Up Keyboard and Mouse](#)” (page 39). When finished, click *Accept* to return to the installation summary.

1.12.5 User Settings

Change the current *User* settings and change or set the *Root Password* here. This is the same configuration as shown earlier in [Section 1.11, “Create New User”](#) (page 21).

1.12.6 Default Runlevel

openSUSE can boot to different runlevels. Normally, there should be no need to change anything here, but if necessary set the default runlevel with this dialog. Refer to Section “Configuring System Services (Runlevel) with YaST” (Chapter 14, *Booting and Configuring a Linux System*, ↑Reference) for more information about runlevel configuration.

1.12.7 System

This dialog presents all the hardware information YaST could obtain about your computer. When called, the hardware detection routine is started. Depending on your system, this may take some time. Select any item in the list and click *Details* to see detailed information about the selected item. Use *Save to File* to save a detailed list to either the local file system or a floppy. Advanced users can also change the PCI ID setup and Kernel Settings by choosing *System Settings*.

1.12.8 Installation from Images

Installing from images considerably speeds up the installation. Images contain compressed snapshots of installed systems matching your selection of patterns. Packages not contained in the images deployed will be installed conventionally.

Unless your custom software selection does not match any of the available images, this feature is *Enabled* by default. In case of problems, *Disable* it for debugging purposes.

1.13 Performing the Installation

After making all installation settings, click *Install* in the Installation Settings window to start the installation. In the dialog that opens, confirm with *Install* again. Some software may require a license confirmation. If your software selection includes such software, license confirmation dialogs are displayed. Click *Accept* to install the software. When not agreeing to the license, click *I Disagree* and the software will not be installed.

The installation usually takes between 15 and 30 minutes, depending on the system performance and the selected software scope. After having prepared the hard disk, having saved and restored the user settings, and having deployed the installation images, the software installation starts. During this procedure a slide show introduces the features of openSUSE. Choose *Details* to switch to the installation log or *Release Notes* to read important up-to-date information which was not available when the manuals were printed.

NOTE: Release Notes

The release notes that can be viewed during this step are the ones printed on the installation CD. A newer version may be available on the Internet. When manually configuring network and Internet access as described in [Section “Network Configuration”](#) (page 31), the latest version of the release notes will be displayed at the end of the installation.

After the software installation has completed, the basic system is set up. Among others, “Finishing the Basic Installation” includes installing the boot manager, initializing fonts and more. Next YaST boots into the new Linux system, where you can configure the hardware and set up system services.

TIP: Existing SSH Host Keys

If you install openSUSE on a machine with existing Linux installations, the installation routine automatically imports the SSH host key with the most recent access time from an existing installation.

1.14 Configuration of the Installed System

The system is now installed, but not yet configured for use. The hardware, the network and other services are not set up, yet. If you follow the default installation path, the system will be automatically configured. If you have deselected the *Automatic Configuration*, the manual system configuration starts.

1.14.1 Automatic Configuration

Having rebooted, the system starts the Automatic Configuration. This routine attempts to configure your network and Internet access and sets up your hardware. The whole process does not need any interaction. You can change the settings made by the Automatic Configuration at any time in the installed system with YaST. Continue with [Section 1.15, “Graphical Login”](#) (page 35).

1.14.2 Manual Configuration

Having rebooted, the system starts the manual configuration. If the configuration fails at one of the steps of this stage, it restarts and continues from the last successful step.

Hostname and Domain Name

The hostname is the computer's name in the network. The domain name is the name of the network. A hostname and domain are proposed by default. If your system is part of a network, the hostname has to be unique in this network, whereas the domain name has to be common to all hosts on the network.

In many networks, the system receives its name over DHCP. In this case it is not necessary to modify the hostname and domain name. Select *Change Hostname via DHCP* instead. To be able to access your system using this hostname, even when it is not connected to the network, select *Write Hostname to /etc/hosts*. If you often change networks without restarting the desktop environment (e.g. when switching between different WLANs), do not enable this option, because the desktop system may get confused when the hostname in `/etc/hosts` changes.

To change hostname settings at any time after installation, use YaST *Network Devices > Network Settings*. For more information, see Section “Configuring the Network Card with YaST” (Chapter 20, *Basic Networking*, ↑Reference).

Network Configuration

If you are installing openSUSE on a laptop computer, *Interfaces Controlled by NetworkManager* is enabled. NetworkManager is a tool that enables automatic connection with minimal user intervention. It is ideal for WLAN and mobile computing. If you want to use the traditional method without NetworkManager, click *Disable NetworkManager*. Find detailed information about NetworkManager in [Chapter 10, Using NetworkManager](#) (page 153). If you are installing openSUSE on any other type of machine, the traditional method without NetworkManager is selected by default. This configuration step also lets you configure the network devices of your system and make security settings, for example, for a firewall or proxy.

The network can also be configured after the system installation has been completed. If you skip it now, your system is left offline unable to retrieve any available updates. To configure your network connection later, select *Skip Configuration* and click *Next*.

The following network settings can be configured in this step:

General Network Settings

Enable or disable the use of NetworkManager as described above. Also change the IPv6 support here. By default the IPv6 support is enabled. To disable it, click *Disable IPv6*. For more information about IPv6, see Section “IPv6—The Next Generation Internet” (Chapter 20, *Basic Networking*, ↑Reference).

Firewall

By default SuSEfirewall2 is enabled on all configured network interfaces. To globally disable the firewall for this computer, click on *Disable*. If the firewall is enabled, you may *Open* the SSH port in order to allow remote connections via secure shell. To open the detailed firewall configuration dialog, click on *Firewall*. See Section “Configuring the Firewall with YaST” (Chapter 33, *Masquerading and Firewalls*, ↑Reference) for detailed information.

Network Interfaces

All network cards detected by YaST are listed here. If you have already set up a network connection during the installation (as described in [Section “Network Setup”](#) (page 15)) the card used for this connection is listed as *Configured*. A click on

Network Interfaces opens the *Network Settings* dialog, where you can change existing configurations, set up networks cards not configured yet, or add and configure additional cards. See [Section 4.2, “Internet Connection Via Network”](#) (page 60) for checklists of configuration requirements for the various connection types and Section “Configuring the Network Card with YaST” (Chapter 20, *Basic Networking*, ↑Reference) for configuration details.

DSL Connections, ISDN Adapters, and Modems

If your computer is equipped with an internal DSL modem, an internal ADSL Fritz Card, an ISDN card or a modem, clicking on the respective headline opens the configuration dialog. Refer to [Chapter 4, *Accessing the Internet*](#) (page 57) for further information.

VNC Remote Administration

To enable remote administration of your machine via VNC, click *VNC Remote Administration*. Choose *Allow Remote Administration* in the following dialog and adjust your firewall settings accordingly.

Proxy

If you have a proxy server controlling the Internet access in your network, configure the proxy URLs and authentication details in this dialog.

TIP: Resetting the Network Configuration to the Default Values

Reset the network settings to the original proposed values by clicking *Change > Reset to Defaults*. This discards any changes made.

Test Internet Connection

After having configured a network connection, you can test it. For this purpose, YaST establishes a connection to the openSUSE server and downloads the latest release notes. Read them at the end of the installation process. A successful test is also a prerequisite for registering and updating online.

If you have multiple network interfaces, verify that the desired card is used to connect to the Internet. If not, click *Change Device*.

To start the test, select *Yes, Test Connection to the Internet* and click *Next*. In the next dialog, view the progress of the test and the results. Detailed information about the test

process is available via *View Logs*. If the test fails, click *Back* to return to the network configuration to correct your entries.

If you do not want to test the connection at this point, select *No, Skip This Test* then *Next*. This also skips downloading the release notes, registering, and updating online. These steps can be performed any time after the system has been initially configured.

Registration

To get technical support and product updates, first register and activate your product. If you are offline or want to skip this step, select *Configure Later*. This also skips openSUSE online update.

In *Include for Convenience*, select whether to send unsolicited additional information when registering. Click on *Details* to obtain in-depth information about data privacy and the data collected.

IMPORTANT: Support for openSUSE

Free installation support is only available for customers of the openSUSE retail box. Make sure to specify your *Registration Code* in order to become entitled for support. Find more information about the free installation support at <http://www.novell.com/support/products/opensuse/>. Refer to [Section 12.6, “Support for ”](#) (page 194) for more information on all support options available for openSUSE.

Upon a successful registration, a repository containing official online updates is added to the repository catalog. This repository is used in the following *Online Update* step to update your system.

Online Update

If the *Registration* was successful, select whether to perform a YaST online update. If there are any patched packages available on the servers, download and install them now to fix known bugs or security issues. For detailed instructions see Chapter 5, *YaST Online Update* (↑Reference). Directives on how to perform an online update in the installed system are available at [Section 3.3, “Keeping the System Up-to-date”](#) (page 53) or Chapter 5, *YaST Online Update* (↑Reference).

IMPORTANT: Downloading Software Updates

The download of updates might take quite some time, depending on the bandwidth of the Internet connection and the size of the update files. In case the patch system itself is updated, the online update will restart and download more patches after the restart. If the kernel was updated, the system will reboot before completing the configuration.

New Local User

In addition to the user created in part one of the installation, you can create an additional user in this dialog. To create more users, manage groups, modify defaults for new users and set up network authentication, launch the *User Management*. Refer to [Chapter 5, *Managing Users with YaST*](#) (page 61) for more information about user management. To skip this step, just click *Next* without entering any data.

Release Notes

After completing the user authentication setup, YaST displays the release notes. Reading them is recommended, because they contain important up-to-date information which was not available when the manuals were printed. If you successfully tested the Internet connection, read the most recent version of the release notes, as fetched from openSUSE's servers. Use *Miscellaneous > Release Notes* in YaST or start the SUSE Help Center to view the release notes after installation.

Hardware Configuration

At the end of the installation, YaST opens a dialog for the configuration of the graphics card and other hardware components connected to the system, such as printers or sound cards. Click the individual components to start the hardware configuration. For the most part, YaST detects and configures the devices automatically.

You can skip any peripheral devices and configure them later, as described in [Chapter 2, *Setting Up Hardware Components with YaST*](#) (page 37). To skip the configuration, select *Skip Configuration* and click *Next*.

However, when setting up a desktop system you should configure the graphics card right away. Although the display settings as configured by YaST should be generally

acceptable, most users have very strong preferences as far as resolution, color depth, and other graphics features are concerned. To change these settings, select the respective item and set the values as desired.

TIP: Resetting Hardware Configuration to the Default Values

You can cancel any changes to the hardware configuration by clicking *Change > Reset to Defaults*. YaST then shows the original proposal again.

Installation Completed

After a successful installation, YaST shows the Installation Completed dialog. In this dialog, select whether to clone your newly installed system for AutoYaST. To clone your system, select *Clone This System for AutoYaST*. The profile of the current system is stored in `/root/autoyast.xml`.

AutoYaST is a system for installing one or more openSUSE systems automatically without user intervention. AutoYaST installations are performed using a control file with installation and configuration data. Finish the installation of openSUSE with *Finish* in the final dialog.

1.15 Graphical Login

openSUSE is now fully installed and configured. Unless you enabled the automatic login function or customized the default runlevel, you should see the graphical login on your screen in which to enter a username and password to log in to the system. On single user systems with automatic login enabled, the desktop starts automatically.

For a short introduction to the KDE or GNOME desktop environments, refer to the GNOME Quick Start (↑) and the KDE Quick Start (↑). Find detailed information about both desktop environments and about the applications to run on KDE or GNOME in the KDE User Guide (↑KDE User Guide) and the GNOME User Guide (↑GNOME User Guide).

Setting Up Hardware Components with YaST

2

YaST allows you to configure hardware items at installation time as well as in the installed system. Configure additional graphics cards and monitors, adjust mouse and keyboard settings and configure sound hardware. If you need printer or scanner support, use the appropriate YaST modules to configure these hardware items. Learn which hardware components are connected to your computer by using the YaST Hardware Information module.

2.1 Probing Your Hardware

Use YaST, if you want to know more about your hardware or if you need to find out details like vendor and model of a certain hardware to be able to properly configure it. Here and in the following sections we assume that you already started YaST (for example, by pressing Alt + F2 and entering `yast2` followed by the root password, because YaST needs system administrator permissions to change the system files):

- 1 In YaST click *Hardware > Hardware Information*. Hardware probing starts immediately and it will take some time until you see the hardware information tree in a separate window.
- 2 In the hardware information tree recursively click on the plus icons to expand the information about a specific device.
- 3 Click *Close* to leave the hardware information overview.

2.2 Setting Up Graphics Card and Monitor

After the installation you can change the configuration of your graphics system (graphics card and monitor) according to your needs. Such a change can be necessary because of accessibility issues or hardware upgrades.

Change the resolution, if fonts are too small or if circles appear misshapen:

- 1 In YaST, click *Hardware > Graphics Card and Monitor*. SaX2 checks the system resources and displays the *Card and Monitor Properties* dialog.
- 2 Make sure the monitor is properly detected. If not, use *Change* to select the appropriate model from the list.
- 3 Now select an appropriate *Resolution*.

- 4 Test the new configuration before it is applied to the system. Click *OK > Test* and either *Cancel* or *Save* the configuration.

WARNING: Changing Monitor Frequencies

Although there are safety mechanisms, you should still be very careful when manually changing the allowed monitor frequencies. Incorrect values might destroy your monitor. Always refer to the monitor's manual before changing frequencies.

To activate a second monitor, proceed as follows:

- 1 In YaST, click *Hardware > Graphics Card and Monitor*. SaX2 checks the system resources and displays the *Card and Monitor Properties* dialog.
- 2 Make sure the monitor is properly detected. If not, use *Change* to select the appropriate model from the list.
- 3 Now enable *Activate Dual Head Mode* and click *Configure* for further tuning.
- 4 Make sure the second monitor is properly detected. If not, use *Change* to select the appropriate model from the list.
- 5 Decide whether you want to use the second monitor in *Cloned Multihead* or in *Xinerama Multihead* mode and click *Ok*.
- 6 Test the new configuration before it is applied to the system. Click *OK > Test* and either *Cancel* or *Save* the configuration.

NOTE: Restarting the X Server

Any changes you make here take effect only after you restart the X server. If you want to restart the X server now, log out from the graphical system and log in again.

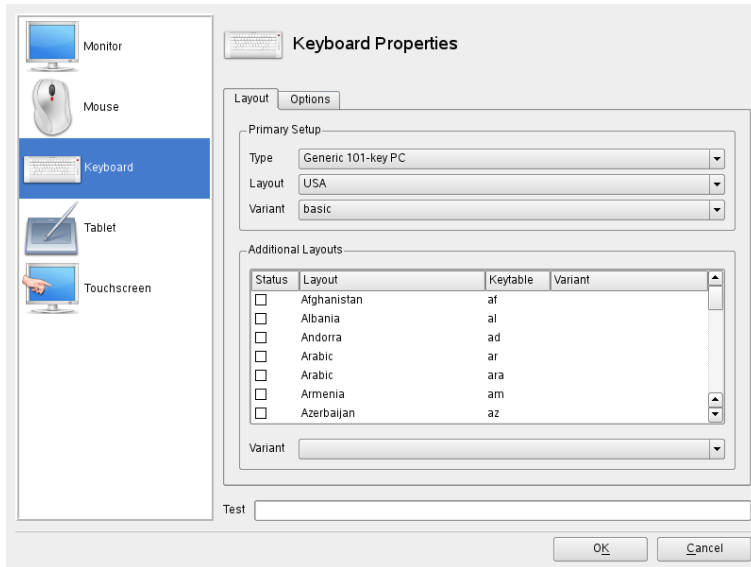

2.3 Setting Up Keyboard and Mouse

Reconfigure input devices such as the keyboard or the mouse, or add more than one of these devices using the YaST Keyboard and Mouse modules.

2.3.1 Keyboard Layout

In case you want to replace a standard 104-key keyboard with a multimedia keyboard or a use different language or country layout, proceed as follows:

- 1 In YaST, click *Hardware > Keyboard Layout*. The SaX2 configuration tool reads the system resources and displays the *Keyboard Properties* dialog.

- 2 Select your keyboard model from the *Type* list.
- 3 In *Layout*, select the country layout.
- 4 Depending on the country layout, you can choose a certain *Variant*. The selections are applied immediately for testing.
- 5 As an option you can enable *Additional Layouts*. Check one or more boxes in the list. This feature is handy if you want to switch between different languages or scripts in the running system without the need for reconfiguration.
- 6 Before saving the configuration, use the *Test* field at the bottom of the dialog to check if special characters like umlauts and accented characters can be entered and displayed correctly.

- 7 Click *OK* to leave the configuration dialog and in the following message click *Save* to apply your changes.

NOTE: Configuring Console Keyboard Layout

By clicking the *Save* button as described in [Step 7](#) (page 41) the setup of the console keyboard layout takes place at the same time. If you want to change the console keyboard layout, either call `yast keyboard` (the text mode interface) or check the `KEYTABLE` and `YAST_KEYBOARD` settings in `/etc/sysconfig/keyboard`.

2.3.2 Mouse Model

The mouse is usually detected automatically, but you can set up your mouse model manually if the automatic detection fails. Refer to the documentation of your mouse for a description of the model. If you want to modify your mouse configuration, proceed as follows:

- 1 In YaST, click *Hardware > Mouse Model*. The SaX2 configuration tool reads the system resources and displays the *Mouse Properties* dialog.
- 2 Click *Change* and select your mouse model from the list displayed.
- 3 Click *OK* to leave the configuration dialog and apply your changes with *Save*.

In the *Options* part of the dialog, set various options for operating your mouse.

Activate 3-Button Emulation

If your mouse has only two buttons, a third button is emulated whenever you click both buttons simultaneously.

Activate Mouse Wheel

Check this box to use a scroll wheel.

Invert X-Axis / Invert Y-Axis

Check these options if you want to change the direction in which the mouse pointer moves.

Activate Left-Hand Button Mapping

Check this box to make the button mapping suitable for left-hand usage.

Emulate Wheel with Mouse Button

If your mouse does not have a scroll wheel but you want to use a similar functionality, you can assign an additional button for this. Select the button to use. While pressing this button, any movement of the mouse is translated into scroll wheel commands. This feature is especially useful with trackballs.

2.4 Setting Up Sound Cards

Most sound cards are detected automatically and configured with reasonable values. In YaST, use *Hardware > Sound* if you want to add a problematic sound card that could not be configured automatically or change the default settings. It is also possible to set up additional sound cards or switch their sequence.

TIP: Probing for Old Sound Chips

If you know a legacy sound board is installed in your computer, let YaST probe for old chips, if YaST cannot find a sound board. Within the pop-up click *Yes, probe*.

If YaST cannot detect your sound card automatically, proceed as follows:

- 1 Click *Add* to open a dialog in which to select a sound card vendor and model. Refer to your sound card documentation for the information required. Find a reference list of sound cards supported by ALSA with their corresponding sound modules in `/usr/share/doc/packages/alsa/cards.txt` and at <http://www.alsa-project.org/alsa-doc/>.

Make your choice and click *Next*.

- 2 In the *Sound Card Configuration* dialog, choose the configuration level in the first setup screen:

Quick automatic setup

You are not required to go through any of the further configuration steps and no sound test is performed. The sound card is configured automatically.

Normal setup

Adjust the output volume and play a test sound.

Advanced setup with possibility to change options

Customize all settings manually.

Enable *Configure joystick*, if you need to configure a joystick. Click *Next* to continue.

- 3** In *Sound Card Volume*, test your sound configuration and make adjustments to the volume. You should start at about ten percent to avoid damage to your hearing or the speakers. A test sound should be audible when you click *Test*. If you cannot hear anything, increase the volume. Press *Next > Finish* to complete the sound configuration.

If you want to change the configuration of a sound card, go to the *Sound Configuration* dialog, select a displayed *Card Model* and click *Edit*. Use *Delete* to remove a sound card altogether.

Click *Other* to customize one of the following options manually:

Volume

Use this dialog is for setting the volume.

Start Sequencer

For playback of MIDI files, check this option.

Set as Primary Card

Click *Set as Primary Card* if you want to adjust the sequence of your sound cards. The sound device with index 0 is the default device and thus used by the system and the applications.

The volume and configuration of all sound cards installed are saved when you click *Finish*. The mixer settings are saved to the file `/etc/asound.conf` and the ALSA configuration data is appended to the end of the files `/etc/modprobe.d/sound` and `/etc/sysconfig/hardware`.

2.5 Setting Up a Printer

YaST can be used to configure a local printer that is directly connected to your machine (normally with USB or parallel port) and to set up printing with network printers. It is also possible to share printers over the network and to add 3rd party “drivers” (PostScript Printer Description (PPD) files). Further information about printing (concepts, technical details, and troubleshooting) is available in Chapter 9, *Printer Operation* (↑Reference).

In YaST, click *Hardware > Printer* to start the printer module. By default it opens in the *Printer Configurations* view, displaying a list of all printers available and configured. This is especially useful when having access to a lot of printers via the network. From here you can also *Print a Test Page* on the selected printer and configure local printers.

2.5.1 Configuring Local Printers

If an unconfigured local printer is detected, YaST starts automatically to configure it. YaST can configure the printer automatically if the parallel or USB port can be set up automatically and the connected printer can be detected. The printer model must also be listed in the database used during the automatic hardware detection.

If the printer model is unknown or cannot be automatically detected, configure it manually. There are two possible reasons why a printer is not automatically detected:

- The printer does not identify itself correctly. This may apply to very old devices. Try to configure your printer as described in [Section “Configuring Manually”](#) (page 44).
- If the manual configuration does not work, communication between printer and computer is not possible. Check the cable and the plugs to make sure that the printer is properly connected. If this is the case, the problem may not be printer-related, but rather a USB or parallel port–related problem.

Configuring Manually

To manually configure the printer, select *Add* in the *Printer Configurations* view. YaST will load a list of printer drivers—this may take some time. Use the *Connection Wizard* to specify how the printer is connected to the machine. Then choose a suitable driver and specify a unique name for the printer queue in the *Set Name* field.

A printer is never used directly, but always through a printer queue. This ensures that simultaneous jobs can be queued and processed one after the other. Each printer queue is assigned to a specific driver, and a printer can have multiple queues. This makes it possible to set up a second queue on a color printer, that prints black only, for example. Refer to Section “The Workflow of the Printing System” (Chapter 9, *Printer Operation*, ↑Reference) for more information about print queues.

For many printer models, several drivers are available. When configuring the printer, YaST defaults to the one marked `recommended` as a general rule. Normally it is necessary to change the driver—the `recommended` one should produce the best results. However, if you want a color printer to print only in black and white, it is most convenient to use a driver that does not support color printing, for example. If you experience performance problems with a PostScript printer when printing graphics, it may help to switch from a PostScript driver to a PCL driver (provided your printer understands PCL).

If no driver for your printer is listed, you can try to select a generic driver with an appropriate standard language from the list. Refer to your printer's documentation to find out which language (the set of commands controlling the printer) your printer understands. If this does not work, refer to **Section “Adding Drivers with YaST”** (page 45) for another possible solution.

The printer is now configured with the default settings and ready to use. Click *Finish Add* to return to the *Printer Configurations* view. The newly configured printer is now visible in the printers list.

Adding Drivers with YaST

If your printer does not appear in the *Assign Drivers* dialog when adding a new printer, the PPD (PostScript Printer Description) file for your model is not available. For more information about PPD files, refer to Section “Installing the Software” (Chapter 9, *Printer Operation*, ↑Reference). To manually add a PPD file from the local file system or an FTP or HTTP server, choose *Add Driver*.

Get PPD files directly from your printer vendor or from the driver CD of the printer. For details, see Section “No Suitable PPD File Available for a PostScript Printer” (Chapter 9, *Printer Operation*, ↑Reference). Alternatively, you can also find PPD files at <http://www.linuxfoundation.org/en/OpenPrinting/>, the “OpenPrinting.org printer database”. When downloading PPD files from OpenPrinting.org,

keep in mind that it always shows the latest Linux support status, which is not necessarily met by openSUSE.

Fine-tuning a Local Printer Configuration

In order to adjust the default settings for paper size, resolution, media source and others, choose a printer from the list in the *Printer Configurations* view and click *Configure*. In the window for modifying the respective printer queue, you can make detailed adjustments by opening *All options for the Current Driver*. If you have access to more than one printer queue, you can specify whether this should be the *Default Printer*. You may also alter the generic printer *Description* and the *Location* description here.

For many printer models, several drivers are available. When configuring the printer, YaST defaults to the one marked `recommended` as a general rule. See the *Driver* section in the dialog for all drivers available. The one that is currently chosen is marked as *Current Driver*.

Normally it is not necessary to change the driver—the one chosen by YaST should produce the best results. However, if you want a color printer to print only in black and white, it is most convenient to use a driver that does not support color printing, for example. If you experience performance problems with a PostScript printer when printing graphics, it may help to switch from a PostScript driver to a PCL driver (provided your printer understands PCL).

2.5.2 Configuring Printing via the Network with YaST

Network printers are not detected automatically. They must be configured manually using the YaST printer module. Depending on your network setup, you can print to a print server (CUPS, LPD, SMB, or IPX) or directly to a network printer (preferably via TCP). Access the configuration view for network printing by choosing *Printing via Network* from the left pane in the YaST printer module.

Using CUPS

In a Linux environment CUPS is usually used to print via the network. The simplest setup is to only print via a single CUPS server which can directly be accessed by all

clients. Check *Do All Your Printing Directly via One Remote CUPS Server* and specify the name or IP address of the server. Click *Test the Server* to make sure you have chosen the correct name/IP address. Leave with *OK*.

If you print via more than one CUPS server, check *Receive Printer Information from remote CUPS Servers*. Specify, whether you want to listen to servers in all networks available, to servers in your local network, or to specific IP addresses. This setup needs a running local CUPS daemon that communicates with the remote CUPS servers. Therefore answer *Yes* when asked to start a local CUPS daemon.

Using Print Servers other than CUPS

If your network offers print services via print servers other than CUPS, start the *Connection Wizard* and choose the appropriate *Connection* type. Ask your network administrator for details on configuring a network printer in your environment.

2.5.3 Sharing Printers Over the Network

Printers managed by a local CUPS daemon can be shared over the network and so turn your machine into a CUPS server. Usually you share a printer by enabling CUPS' so called "browsing mode". If browsing is enabled, the local printer queues are made available on the network for listening remote CUPS daemons. It is also possible to set up a dedicated CUPS server, that manages all printing queues and can directly be accessed by remote clients. In this case it is not necessary to enable browsing.

To share your printer, open the *Share Printers* view in the YaST printer module. Select *Allow Remote Access* and configure your CUPS daemon to be accessible *For Computers Within the Local Network*. To enable the browsing mode, also check *Publish Printers by Default Within the Local Network*. Then specify the network interface(s) that should be used by the CUPS server. If you enable more than one interface, you can also enable or disable the browsing mode on a per interface base. Apply the settings with *OK* and allow to restart the CUPS server.

Installing, Removing and Updating Software

3

Change the software collection of your system using YaST. In YaST's software management tool search for software components you want to add or remove. YaST resolves all the dependencies for you. Keep your system up-to-date by managing software updates with openSUSE Updater.

3.1 Installing Software

Software is available via RPM packages or groups together in so-called patterns. Each package contains the program itself, the configuration files, and additional documentation. If you want the program (package) to be added to the system, proceed as follows (if you have KDE running—for GNOME see below):

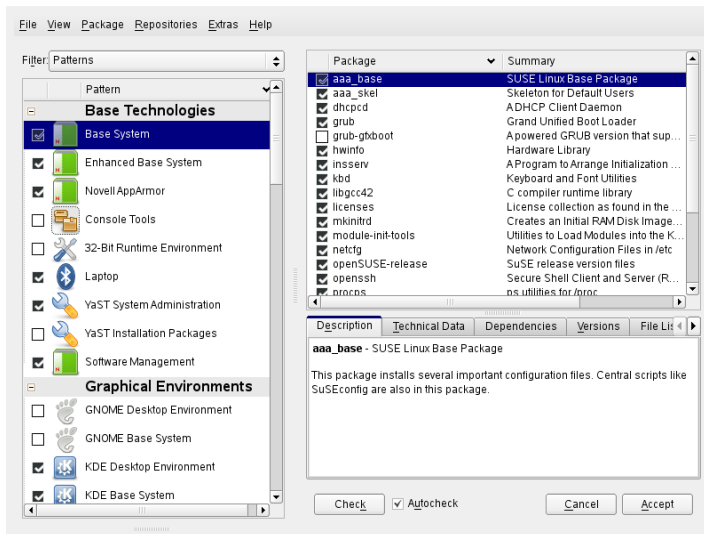

- 1 Click *Software > Software Management* to start the YaST package manager.
- 2 In the search field enter the name of the software you want to install (for example, `jhead`, a tool for manipulating JPEG meta data) and press **Enter**.
- 3 The package is listed in the right frame. Select it for installation. Once done, you can search for more packages and select them for installation in one go.
- 4 Click *Accept*.
- 5 When all selected packages are installed, YaST asks you whether you want to install or remove additional packages. Press *No* to close YaST.

With GNOME running, proceed as follows:

- 1 Click *Software > Software Management* to start the YaST package manager.
- 2 In the package search field enter the name of the software you want to install (for example, `jhead`, a tool for manipulating JPEG meta data). Once found, select it in the main pane and click *Install*.
- 3 If wanted you can search for more packages and list them the same way.
- 4 Click *Apply* to install the listed packages.

You can also install software patterns. Patterns are sets consisting of tools for a specific task; for example, there is a pattern for “Technical Writing” that consists of XML tools, special editors, the LaTeX environment, and more. To install a pattern, proceed as follows (if you have KDE running—for GNOME see below):

- 1 From the filter list in the upper left corner, select *Patterns*. Now you see various pattern sets listed in the area below.

- 2 From the patterns select one or more patterns you are interested in. If you click on the name of a pattern, for example on *Technical Writing*, you see the packages

it contains, in the right frame. If you activate it, the status markers at the beginning of the line will change: all packages get marked either with the status *Keep* or *Install*. The meaning of all the symbols and of font color changes is explained in *Help > Symbols*.

3 Click *Accept*.

With GNOME running, proceed as follows to install a pattern:

- 1 From the grouping menu in the upper left corner, select *Patterns*. Now you see various pattern sets listed in the area below.

- 2 From the patterns select one or more patterns you are interested in. If you click on the name of a pattern, for example on *Technical Writing*, you see the packages

it contains, in the right frame. Click *Install All* to activate it and list the packages for installation.

- 3 Click *Apply* to install the listed packages.

3.2 Removing Software

If you want to remove software from the system, proceed as follows if you have KDE running (for GNOME see below):

- 1 Make use of a search strategy explained in [Section 3.1, “Installing Software”](#) (page 49).
- 2 Depending on the search strategy, you can either select a complete set or single packages one by one. For patterns, both ways are possible.
- 3 Click *Accept* and either watch the uninstallation progress or adjust your selection, if YaST complains about dependency issues.

With GNOME running, proceed as follows:

- 1 Make use of a search strategy explained in [Section 3.1, “Installing Software”](#) (page 49).
- 2 In the *Packages Listing* mark the packages you want to remove. To mark all of them with one click, right-click in the *Packages Listing* pane and click *Select All*.
- 3 Click *Remove*.

If you try to remove a package which is required by installed software, the conflict manager will complain about dependency issues and you must resolve the conflicts first as described in Section “Checking Software Dependencies” (Chapter 3, *Installing or Removing Software*, ↑Reference).

When all conflicts are resolved, the package scheduled for removing is listed in the *Changes* pane on the right side.

- 4 Click *Apply* to perform all actions listed in the *Changes* pane.

3.3 Keeping the System Up-to-date

openSUSE offers a continuous stream of software security patches for your product. The openSUSE Updater applet informs you about the availability of patches and lets you easily install them with just a few clicks. The openSUSE community also provides updates to newer versions of software packages. openSUSE Updater optionally keeps a list of all programs installed on your system and informs you whenever newer versions are available. Whats more, openSUSE Updater can also search for and install new drivers when new hardware is attached.

NOTE: Patches vs. New Versions

The patches offered by openSUSE either fix security holes or serious errors in the software. A patch normally does not upgrade to a newer version and does not offer additional functionality. A new program version offered by the community may offer fixes, too, but primarily adds new functionality.

The openSUSE Updater applet resides in the system tray (KDE) of your panel or in the notification area (GNOME) as an icon depicting the head of the openSUSE mascot (Geeko), which changes depending on the availability and relevance of patches and the status of openSUSE Updater. Whenever the icon changes, a tool tip displaying the current status is shown, too.

Green Geeko Head with Green Arrows

No patches available. When new versions are available, a tool tip appears when the mouse is moved over the icon.

Green Geeko Head with Yellow Arrows (KDE) / Gray Geeko (GNOME)

openSUSE Updater is busy (for example checking for updates, installing software).

Red Triangle with Exclamation Mark

Security patches available.

Orange Star with Arrow

Recommended or optional patches are available.

Yellow Triangle with Exclamation Mark

An error occurred.

Blue Circle with Question Mark

No update repository is defined. When you click the openSUSE Updater in this state, you are asked whether to check for updates. If you agree, the YaST *Online Update Configuration* module is started.

3.3.1 Installing Patches

Whenever the openSUSE Updater icon shows the availability of patches, left-click to open the software installation window. It lists the number of *Security* and *Recommended* patches available. While the security patches are installed by default, you can choose whether to install the recommended ones as well. Some patches, such as new kernel versions, require to restart your computer. Check *Do not Install Updates that Require a Restart* to skip these updates for now. Start updating your system by clicking *Install*.

A click on *Details* opens the *Available Updates* window which shows a detailed list of all patches and allows you to alter the selection of packages that will be installed. Apart from the patch name the *Type* (*Security*, *Recommended* or *Optional*), a short *Summary* and the patch version number is shown. Patches are sorted alphabetically by default—change this by clicking on a column headline (*Name*, *Summary*, *Type*, *New Version*, *Catalog*, or *Restart*). Click *Install* to proceed.

You will be prompted for the `root` password after having proceeded with *Install*. openSUSE Updater performs the installation of the patches. See the system tray (KDE) or the notification area (GNOME) for status messages and a progress meter.

The YaST Online Update offers advanced features to customize the patch installation. Please refer to Chapter 5, *YaST Online Update* (↑Reference) for more information.

3.3.2 Installing New Software Versions

New software versions are available from software repositories provided by the openSUSE community. By default, no such repositories are preconfigured. To add a repository, right-click on the openSUSE Updater icon and choose *Add/Remove Update Sources*. You need to enter the `root` password to start the *Configured Software Repositories* module. A list from which you can choose popular community repositories is already preconfigured (*Add > Community Repositories*), for even more community

repositories refer to http://en.opensuse.org/Additional_YaST_Package_Repositories.

WARNING: Trusting External Software Sources

Before adding external software repositories to your list of repositories make sure this repository can be trusted. openSUSE is not responsible for any potential problems arising from software installed from third party software repositories.

openSUSE Updater does not monitor repositories for new software versions by default. To enable this feature, open the configuration window as described in [Section 3.3.3, “Configuring openSUSE Updater”](#) (page 55) and tick the check box *Show Available Upgrades When Back-End Provides Them* check box. When the openSUSE Updater icon indicates the availability of updates, click on the icon to launch the software installation window. Click on *Details* and then on the *Upgrade* tab to open the list with new software versions. Either select single packages by checking the box in front of an entry, or click *Select All Packages*. *Install* starts the installation of the selected software packages. You will be prompted for the `root` password. See the system tray (KDE) or the notification area (GNOME) for status messages and a progress meter.

3.3.3 Configuring openSUSE Updater

By default openSUSE Updater is started on login, checks for updates every 24 hours, shows recurring notifications every 60 minutes and only monitors the availability of patches. To change this behavior, right-click the applet icon and choose *Configure Applet*.

Figure 3.1 *openSUSE Updater: Configuration*

The configuration dialog also offers to change the following settings:

Back-End

Choose between different back-ends. The *Package Kit Plugin* is used by default. If you prefer the *ZYpp Plugin*, make sure the package `kde4-kupdateapplet-zypp` is installed.

Always Show Detailed View

Activate this option when you prefer the detailed patch view that lists all patches available with short summaries rather than the simple view.

Check for Updates only When System Is Connected to Charger

Prohibits checking for updates when running on batteries in order to save power. This option is activated by default but only affects mobile computers.

Check for Updates only When System Is under Low Load

Prohibits checking for updates when the system is under heavy load. This option is activated by default.

Search for Drivers When New Hardware is Attached

Provided a repository offering appropriate drivers, openSUSE Updater can automatically install drivers for hardware such as USB devices.

Accessing the Internet

If you have chosen not to configure Internet access during the installation, you can perform this task at any time using YaST. How to configure your computer to access the Internet depends on your environment. If the computer you are installing is part of a network which already is connected to the Internet, the only thing to do is to link your machine into the network. If you are installing a machine that is directly connected to the Internet, the hardware and the access to the Internet Service Provider (ISP) need to be set up.

Please refer to the checklists below to make sure you have all the data ready to hand when starting to configure the Internet access.

4.1 Direct Internet Connection

When your computer is directly connected to the Internet, you first need to configure the hardware that is used for this task. This can either be an internal device (such as an ISDN card) or an external device (for example a modem). In most cases it is detected automatically.

In a second step you need to enter data provided by your ISP, such as login credentials, gateway, or name server, for example. You should have received a data sheet from your ISP where all the necessary data is listed.

If you have successfully configured your hardware and ISP data, use the NetworkManager for managing the internet connection. See [Chapter 10, *Using NetworkManager*](#) (page 153) for details.

4.1.1 Checklist DSL

There are different types of DSL devices available that use different point-to-point protocol (PPP) methods:

- a regular ethernet card connected to the external DSL modem uses PPP over Ethernet (PPPoE). In Austria the Point-to-Point Tunneling Protocol (PPTP) is used. With PPTP the external modem also has a static IP address.
- an internal DSL modem uses PPP over ATM (PPPoATM)
- an internal ADSL Fritz Card uses CAPI for ADSL

The DSL configuration module already contains the data for major ISPs in some countries. If your ISP is not listed, you will need to know how name resolving (DNS) and IP allocation is handled (in most cases this data is received automatically when connecting). Regardless whether you choose an ISP from the list or add a custom provider, you need to enter at least your login and password.

For configuration details, refer to Section “DSL” (Chapter 20, *Basic Networking*, ↑Reference).

4.1.2 Checklist ISDN

In case your internal ISDN card is not detected automatically you will need to know the vendor and the name of the device.

NOTE: ISDN Modem or Terminal Adapter

If you are using an external ISDN modem or terminal adapter, refer to [Section 4.1.3, “Checklist Modem”](#) (page 59) instead.

In order to configure the ISDN device you will need the following data:

- ISDN Protocol (depends on your country)
- Area code and phone number.

- Interface type (SyncPPP or RawIP). If unsure, select SyncPPP, because RawIP is only used in connection with certain telephone systems.
- In case you got a static IP-address from your provider: local and remote IP-addresses for the dial-in server and the gateway.
- The ISDN configuration module already contains the data for major ISPs in some countries. If your ISP is not listed, you will need to know how name resolving (DNS) and IP allocation is handled (in most cases this data is received automatically when connecting). Regardless whether you chose an ISP from the list or added a custom provider, you need to enter at least your login and password.

For configuration details, refer to Section “ISDN” (Chapter 20, *Basic Networking*, ↑Reference).

4.1.3 Checklist Modem

In case your modem is not detected automatically, you need to know whether it is connected to a serial port or to an USB port. Please note that not all USB modems and internal modems are supported by openSUSE®.

The modem configuration module already contains the data for major ISPs in some countries. If your ISP is not listed, you will need to know its dial-in number and how name resolving (DNS) and IP allocation is handled (in most cases this data is received automatically when connecting). Regardless whether you chose an ISP from the list or added a custom provider, you need to enter at least your login and password.

For configuration details, refer to Section “Modem” (Chapter 20, *Basic Networking*, ↑Reference).

4.1.4 Checklist Cable Modem

Accessing the Internet through the TV cable requires a cable modem. Such a modem is connected to the computer via ethernet cable. Therefore it is only necessary to configure your network card accordingly. For details, refer to Section “Cable Modem” (Chapter 20, *Basic Networking*, ↑Reference).

4.2 Internet Connection Via Network

If your machine is part of a network which is already connected to the Internet, it is very easy to gain Internet access—just configure your network card and connect your machine to the existing network and you are done. This not only applies to large company networks, but to small home networks as well. Even if the machine you are installing is only connected to a router (e.g. a DSL router) it is already part of a network.

NOTE: Routing and Name Services

In the following it is assumed that the network is connected to the Internet and provides routing and name services. In case these services are provided by a router, make sure the router is configured correctly before setting up the client.

4.2.1 Checklist Network

If your network provides DHCP (Dynamic Host Configuration Protocol) check the appropriate check box when setting up the network card and you are done—all parameters needed will be provided by the DHCP server.

In case DHCP is not available, ask your network administrator for the following details:

- Hostname
- Name server
- Gateway

For configuration details, refer to Section “Configuring the Network Card with YaST” (Chapter 20, *Basic Networking*, ↑Reference).

Managing Users with YaST

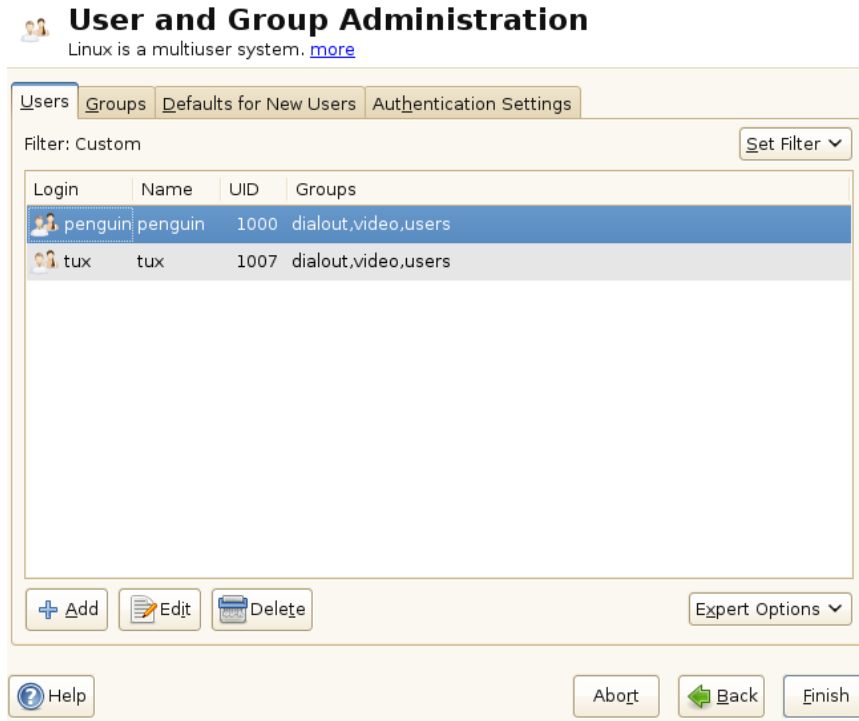

During installation, you have chosen a method for user authentication . This method is either local (via `/etc/passwd`) or, if a network connection is established, via NIS, LDAP, Kerberos or Samba (see [Section 1.11, “Create New User”](#) (page 21)). You can create or modify user accounts and can change the authentication method with YaST at any time.

Every user is assigned a user ID (UID) which identifies him in the system. Apart from the users which can log in to your machine, there are also a number of *system users* for internal use only. Each user is assigned to one or more groups. Similar to *system users*, there are also *system groups* for internal use. For information about the Linux user and group concept, refer to [Section 7.1, “User Concept”](#) (page 87).

5.1 User and Group Administration Dialog

To administrate users or groups, start YaST and click *Security and Users > User and Group Management*. Alternatively, start the *User and Group Administration* dialog directly by running `yast2 users &` from a command line.

Figure 5.1 *YaST User and Group Administration*

Depending on the set of users you choose to view and modify with the dialog (local users, network users, system users), the main window shows several tabs. These allow you to execute the following tasks:

Managing User Accounts

From the *Users* tab, create, modify, delete or temporarily disable user accounts as described in [Section 5.2, “Managing User Accounts”](#) (page 63). Learn about advanced options like enforcing password policies, using encrypted home directories, using fingerprint authentication, or managing disk quotas in [Section 5.3, “Additional Options for User Accounts”](#) (page 65).

Changing Default Settings

Local users accounts are created according to the settings defined on the *Defaults for New Users* tab. Learn how to change the default group assignment, or the default

path and access permissions for home directories in [Section 5.4, “Changing Default Settings for Local Users”](#) (page 73).

Assigning Users to Groups

Learn how to change the group assignment for individual users in [Section 5.5, “Assigning Users to Groups”](#) (page 74).

Managing Groups

From the *Groups* tab, you can add, modify or delete existing groups. Refer to [Section 5.6, “Managing Groups”](#) (page 74) for information how to do this.

Changing the User Authentication Method

When your machine is connected to a network providing user authentication methods like NIS or LDAP, you can choose between several authentication methods on the *Authentication Settings* tab. For more information, refer to [Section 5.7, “Changing the User Authentication Method”](#) (page 76).

For user and group management, the dialog provides similar functionality. You can easily switch between the user and group administration view by choosing the appropriate tab at the top of the dialog.

Filter options allow you to define the set of users or groups you want to modify: On the *Users* or *Group* tab, click *Set Filter* to view and edit users or groups according to certain categories, such as *Local Users* or *LDAP Users*, for instance (if you are part of a network which uses LDAP). With *Set Filter > Customize Filter* you can also set up and use a custom filter.

Depending on the filter you choose, not all of the following options and functions may be available from the dialog.

5.2 Managing User Accounts

YaST offers to create, modify, delete or temporarily disable user accounts. Do not modify user accounts unless you are an experienced user or administrator and know about the implications.

NOTE: Changing User IDs of Existing Users

File ownership is bound to the user ID, not to the user name. After a user ID change, the files in the user's home directory are automatically adjusted to reflect this change. However, after an ID change, the user does no longer own the files he created elsewhere in the file system unless you manually change the file ownership for those files.

In the following, learn how to set up default user accounts. For some further options, such as auto login, login without password, setting up encrypted home directories or managing quotas for users and groups, refer to [Section 5.3.5, “Managing Quotas”](#) (page 70).

Procedure 5.1 *Adding or Modifying User Accounts*

- 1 Open the YaST *User and Group Administration* dialog and click the *Users* tab.
- 2 With *Set Filter* define the set of users you want to manage. The dialog shows a list of users in the system and the groups the users belong to.
- 3 To modify options for an existing user, select an entry and click *Edit*.

To create a new user account, click *Add*.

- 4 Enter the appropriate user data on the first tab, such as *Username* (which is used for login) and *Password*. This data is sufficient to create a new user. If you click *OK* now, the system will automatically assign a user ID and set all other values according to the default.
- 5 Activate *Receive System Mail* if you want any kind of system mails to be delivered to this user's mailbox. This creates a mail alias for `root` and the user can read the system mail without having to log in as `root` first.
- 6 If you want to adjust further details such as the user ID or the path to the user's home directory, do so on the *Details* tab.

If you need to relocate the home directory of an existing user, enter the path to the new home directory there and move the contents of the current home directory with *Move to New Location*. Otherwise, a new home directory is created without any of the existing data.

- 7 To force users to regularly change their password or set other password options, switch to *Password Settings* and adjust the options.
- 8 If all options are set according to your wishes, click *OK*.
- 9 Click *Expert Options > Write Changes Now* to save all changes without exiting the *User and Group Administration* dialog. Or click *Finish* to close the administration dialog and to save the changes. A newly added user can now log in to the system using the login name and password you created.

TIP: Matching User IDs

For a new (local) user on a laptop which should also integrate in a network environment where this user already has a user ID, it is useful to match the (local) user ID to the ID in the network. This ensures that the file ownership of the files the user creates “offline” is the same as if he created them directly on the network.

Procedure 5.2 *Disabling or Deleting User Accounts*

- 1 Open the YaST *User and Group Administration* dialog and click the *Users* tab.
- 2 To temporarily disable a user account without deleting it, select the user from the list and click *Edit*. Activate *Disable User Login*. The user cannot log in to your machine until you enable the account again.
- 3 To delete a user account, select the user from the list and click *Delete*. Choose if you also want to delete the user's home directory or if you want to retain the data.

5.3 Additional Options for User Accounts

In addition to the settings for a default user account, openSUSE® offers further options, such as options to enforce password policies, to use encrypted home directories or to define disk quotas for users and groups.

5.3.1 Automatic Login and Passwordless Login

If you use KDE or GNOME desktop environment you can configure *Auto Login* for a certain user as well as *Passwordless Login* for all users. Auto login causes a user to become automatically logged in to the desktop environment on boot. This functionality can only be activated for one user at a time. Login without password allows all users to log in to the system after they have entered their username in the login manager.

WARNING: Security Risk

Enabling *Auto Login* or *Passwordless Login* on a machine that can be accessed by more than one person is a security risk. Without the need to authenticate, any user can gain access to your system and your data. If your system contains confidential data, do not use this functionality.

If you want to activate auto login or login without password, access these functions in the YaST *User and Group Administration* with *Expert Options* > *Login Settings*.

5.3.2 Enforcing Password Policies

On any system with multiple users, it is a good idea to enforce at least basic password security policies. Users should change their passwords regularly and use strong passwords that cannot easily be exploited. For local users, proceed as follows:

Procedure 5.3 *Configuring Password Settings*

- 1 Open the YaST *User and Group Administration* dialog and select the *Users* tab.
- 2 Select the user for which to change the password options and click *Edit*.
- 3 Switch to the *Password Settings* tab.
- 4 To make the user change his password at next login, activate *Force Password Change*.

- 5 To enforce password rotation, set a *Maximum Number of Days for the Same Password* and a *Minimum Number of Days for the Same Password*.
- 6 To remind the user to change his password before it expires, set a number of *Days before Password Expiration to Issue Warning*.
- 7 To restrict the period of time the user can log in after his password has expired, change the value in *Days after Password Expires with Usable Login*.
- 8 You can also specify a certain expiration date for a password. Enter the *Expiration Date* in *YYYY-MM-DD* format.
- 9 For more information about the options and about the default values, click *Help*.
- 10 Apply your changes with *OK*.

5.3.3 Managing Encrypted Home Directories

To protect data in home directories against theft and hard disk removal, you can create encrypted home directories for users. These are encrypted with LUKS (Linux Unified Key Setup), which results in an image and an image key generated for the user. The image key is protected with the user's login password. When the user logs in to the system, the encrypted home directory is mounted and the contents are made available to the user.

NOTE: Fingerprint Reader Devices and Encrypted Home Directories

If you want to use a fingerprint reader device, you must not use encrypted home directories. Otherwise logging in will fail, because decrypting during login is not possible in combination with an active fingerprint reader device.

With YaST, you can create encrypted home directories for new or existing users. To encrypt or modify encrypted home directories of already existing users, you need to know the user's current login password. By default, all existing user data is copied to the new encrypted home directory, but it is not deleted from the unencrypted directory.

WARNING: Security Restrictions

Encrypting a user's home directory does not provide strong security from other users. If strong security is required, the system should not be physically shared.

Find background information about encrypted home directories and which actions to take for stronger security in Section “Using Encrypted Home Directories” (Chapter 36, *Encrypting Partitions and Files*, ↑Reference).

Procedure 5.4 *Creating Encrypted Home Directories*

- 1 Open the YaST *User and Group Management* dialog and click the *Users* tab.
- 2 To encrypt the home directory of an existing user, select the user and click *Edit*.

Otherwise, click *Add* to create a new user account and enter the appropriate user data on the first tab.
- 3 In the *Details* tab, activate *Use Encrypted Home Directory*. With *Directory Size in MB*, specify the size of the encrypted image file to be created for this user.

Existing Local User

Additional user data includes: User ID (uid): Each user is known to the system by a un... [more](#)

- adm

- 4 Apply your settings with *OK*.
- 5 Enter the user's current login password to proceed if YaST prompts for it.
- 6 Click *Expert Options > Write Changes Now* to save all changes without exiting the administration dialog. Or click *Finish* to close the administration dialog and to save the changes.

Procedure 5.5 *Modifying or Disabling Encrypted Home Directories*

Of course, you can also disable the encryption of a home directory or change the size of the image file at any time.

- 1 Open the YaST *User and Group Administration* dialog in the *Users* view.
- 2 Select a user from the list and click *Edit*.
- 3 If you want to disable the encryption, switch to the *Details* tab and disable *Use Encrypted Home Directory*.

If you need to enlarge or reduce the size of the encrypted image file for this users, change the *Directory Size in MB*.

- 4 Apply your settings with *OK*.
- 5 Enter the user's current login password to proceed if YaST prompts for it.
- 6 Click *Expert Options > Write Changes Now* to save all changes without exiting the *User and Group Administration* dialog. Or click *Finish* to close the administration dialog and to save the changes.

5.3.4 Using Fingerprint Authentication

If your system includes a fingerprint reader you can use biometric authentication in addition to standard authentication via login and password. After registering their fingerprint, users can log in to the system either by swiping a finger on the fingerprint reader or by typing in a password.

Fingerprints can be registered with YaST. Find detailed information about configuration and use of fingerprint authentication in Chapter 32, *Using the Fingerprint Reader* (↑Reference). For a list of supported devices, refer to http://reactivated.net/fprint/wiki/Supported_devices.

5.3.5 Managing Quotas

To prevent system capacities from being exhausted without notification, system administrators can set up quotas for users or groups. Quotas can be defined for one or more

file systems and restrict the amount of disk space that can be used and the number of inodes (index notes) that can be created there. Inodes are data structures on a file system that store basic information about a regular file, directory, or other file system object. They store all attributes of a file system object (like user and group ownership, read, write, or execute permissions), except file name and contents.

openSUSE allows usage of `soft` and `hard` quotas. Soft quotas usually define a warning level at which users are informed they are nearing their limit, whereas hard quotas define the limit at which write requests are denied. Additionally, grace intervals can be defined that allow users or groups to temporarily violate their quotas by certain amounts.

Procedure 5.6 *Enabling Quota Support for a Partition*

In order to configure quotas for certain users and groups, you need to enable quota support for the respective partition in the YaST Expert Partitioner first.

- 1** In YaST, select *System > Partitioner* and click *Yes* to proceed.
- 2** In the *Expert Partitioner*, select the partition for which to enable quotas and click *Edit*.
- 3** Click *Fstab Options* and activate *Enable Quota Support*. If the `quota` package is not already installed, it will be installed if you confirm the respective message with *Yes*.
- 4** Confirm your changes and leave the *Expert Partitioner*.

Procedure 5.7 *Setting Up Quotas for Users or Groups*

Now you can define soft or hard quotas for specific users or groups and set time periods as grace intervals.

- 1** In the YaST *User and Group Administration*, select the user or the group you want to set the quotas for and click *Edit*.
- 2** On the *Plug-Ins* tab, select the quota entry and click *Launch* to open the *Quota Configuration* dialog.
- 3** From *File System*, select the partition to which the quota should apply.

Quota Configuration

Here, configure quota settings of the user on selected file systems. [more](#)

I-nodes Limits
Soft limit:
2
Hard limit:
4
Days: 0 Hours: 0 Minutes: 0 Seconds: 0

Help Cancel OK

- 4 Below *Size Limits*, restrict the amount of disk space. Enter the number of 1 KB blocks the user or group may have on this partition. Specify a *Soft Limit* and a *Hard Limit* value.
- 5 Additionally, you can restrict the number of inodes the user or group may have on the partition. Below *Inodes Limits*, enter a *Soft Limit* and *Hard Limit*.
- 6 You can only define grace intervals if the user or group has already exceeded the soft limit specified for size or inodes. Otherwise, the time-related input fields are not activated. Specify the time period for which the user or group is allowed to exceed the limits set above.
- 7 Confirm your settings with *OK*.
- 8 Click *Expert Options > Write Changes Now* to save all changes without exiting the *User and Group Administration* dialog. Or click *Finish* to close the administration dialog and to save the changes.

openSUSE also ships command line tools like `repquota` or `warnquota` with which system administrators can control the disk usage or send e-mail notifications to users

exceeding their quota. With `quota_nld`, administrators can also forward kernel messages about exceeded quotas to D-BUS. For more information, refer to the `repquota`, the `warnquota` and the `quota_nld` man page (root password needed).

5.4 Changing Default Settings for Local Users

When creating new local users, several default settings are used by YaST. These include, for example, the primary group and the secondary groups the user belong to, or the access permissions of the user's home directory. You can change these default settings to meet your requirements:

- 1 Open the YaST *User and Group Administration* dialog and select the *Defaults for New Users* tab.
- 2 To change the primary group the new users should automatically belong to, select another group from *Default Group*.
- 3 To modify the secondary groups for new users, add or change groups in *Secondary Groups*. The group names must be separated by commas.
- 4 If you do not want to use `/home/username` as default path for new users' home directories, modify the *Path Prefix for Home Directory*.
- 5 To change the default permission modes for newly created home directories, adjust the `umask` value in *Umask for Home Directory*. For more information about `umask`, refer to Chapter 18, *Access Control Lists in Linux* (↑Reference) and to the `umask` man page.
- 6 For information about the individual options, click *Help*.
- 7 Apply your changes with *Finish*.

5.5 Assigning Users to Groups

Local users are assigned to several groups according to the default settings which you can access from the *User and Group Administration* dialog on the *Defaults for New Users* tab. In the following, learn how to modify an individual user's group assignment. If you need to change the default group assignments for new users, refer to [Section 5.4, “Changing Default Settings for Local Users”](#) (page 73).

Procedure 5.8 *Changing a User's Group Assignment*

- 1 Open the YaST *User and Group Administration* dialog and click the *Users* tab. It shows a list of users and of the groups the users belong to.
- 2 Click *Edit* and switch to the *Details* tab.
- 3 To change the primary group the user belongs to, click *Default Group* and select the group from the list.
- 4 To assign the user to additional secondary groups, activate the corresponding check boxes in the *Additional Groups* list.
- 5 Click *OK* to apply your changes.
- 6 Click *Expert Options > Write Changes Now* to save all changes without exiting the *User and Group Administration* dialog. Or click *Finish* to close the administration dialog and to save the changes.

5.6 Managing Groups

With YaST you can also easily add, modify or delete groups.

Procedure 5.9 *Creating and Modifying Groups*

- 1 Open the YaST *User and Group Management* dialog and click the *Groups* tab.
- 2 With *Set Filter* define the set of groups you want to manage. The dialog shows a list of groups in the system.

- 3 To create a new group, click *Add*.
- 4 To modify an existing group, select the group and click *Edit*.
- 5 In the following dialog, enter or change the data. The list on the right shows an overview of all available users and system users which can be members of the group.

Existing Local Group

- 6 To add existing users to a new group select them from the list of possible *Group Members* by checking the corresponding box. To remove them from the group just uncheck the box.
- 7 Click *OK* to apply your changes.
- 8 Click *Expert Options > Write Changes Now* to save all changes without exiting the *User and Group Administration* dialog.

In order to delete a group, it must not contain any group members. To delete a group, select it from the list and click *Delete*. Click *Expert Options > Write Changes Now* to

save all changes without exiting the *User and Group Administration* dialog. Or click *Finish* to close the administration dialog and to save the changes.

5.7 Changing the User Authentication Method

When your machine is connected to a network, you can change the authentication method you set during installation. The following options are available:

NIS

Users are administered centrally on a NIS server for all systems in the network. For details, see Chapter 25, *Using NIS* (↑Reference).

LDAP

Users are administered centrally on an LDAP server for all systems in the network. For details about LDAP, see Chapter 26, *LDAP—A Directory Service* (↑Reference).

You can manage LDAP users with the YaST user module. All other LDAP settings, including the default settings for LDAP users, have to be defined with the YaST LDAP client module as described in Section “Configuring an LDAP Client with YaST” (Chapter 26, *LDAP—A Directory Service*, ↑Reference) .

Kerberos

With Kerberos, a user registers once and then is trusted in the complete network for the rest of the session.

Samba

SMB authentication is often used in mixed Linux and Windows networks.

To change the authentication method, proceed as follows:

- 1 Open the *User and Group Administration* dialog in YaST.
- 2 Click the *Authentication Settings* tab to show an overview of the available authentication methods and the current settings.
- 3 To change the authentication method, click *Configure* and select the authentication method you want to modify. This takes you directly to the client configuration

modules in YaST. For information about the configuration of the appropriate client, refer to the following sections:

NIS: Section “Configuring NIS Clients” (Chapter 25, *Using NIS*, ↑Reference)

LDAP: Section “Configuring an LDAP Client with YaST” (Chapter 26, *LDAP—A Directory Service*, ↑Reference)

- 4 After accepting the configuration, return to the *User and Group Administration* overview.
- 5 Click *Finish* to close the administration dialog.

Changing Language and Country Settings with YaST

Working in different countries or having to work in a multilingual environment requires your computer to be set up to support this. Use the YaST language and timezone modules to install additional system languages and adjust the country and timezone settings accordingly. The YaST language module also lets you change your system language or determine a primary language that you use most often. Install secondary languages to get optional localizations if you need to start applications or desktops in languages other than the primary one. The YaST timezone module allows you to adjust your country and timezone settings and synchronize your system clock against a time server.

6.1 Changing the System Language

Depending on how you use your desktop and whether you want to switch the entire system to another language or just the desktop environment itself, there are several ways to achieve this:

Change the System Language Globally

Proceed as described in [Section 6.1.1, “Installing Additional System Languages”](#) (page 80) and [Section 6.1.2, “Switching the System Language”](#) (page 82) to install additional localized packages with YaST and set the default language. Changes are effective after relogin. To ensure that the entire system reflects the change, reboot the system or close and restart all running services, applications, and programs.

Change the Language for the Desktop Only

Provided you have previously installed the desired language packages for your desktop environment with YaST as described below, you can switch the language

of your desktop using the desktop's control center. After X has been restarted, your entire desktop reflects your new choice of language. Applications not belonging to your desktop framework are not affected by this change and may still appear in the language that was set in YaST.

Temporarily Switch Languages for One Application Only

To run a single application in another language (that has already been installed with YaST), use one of the following commands:

- `LANG=de_DE application` to start any standard X application or GNOME application in German. For other languages, use the appropriate language code. Get a list of all language codes available using the `locale -av` command.
- `KDE_LANG=de application` to start any KDE application in German. For other languages, use the appropriate language code.

6.1.1 Installing Additional System Languages

The main language was selected during installation (see [Section 1.6, “Welcome”](#) (page 12)) and keyboard and time zone settings were adjusted. However, you can install additional languages on your system and determine which of the different languages installed should be taken as the default. Before installing additional languages, determine which of them should be activated after you install it. YaST knows two different language categories:

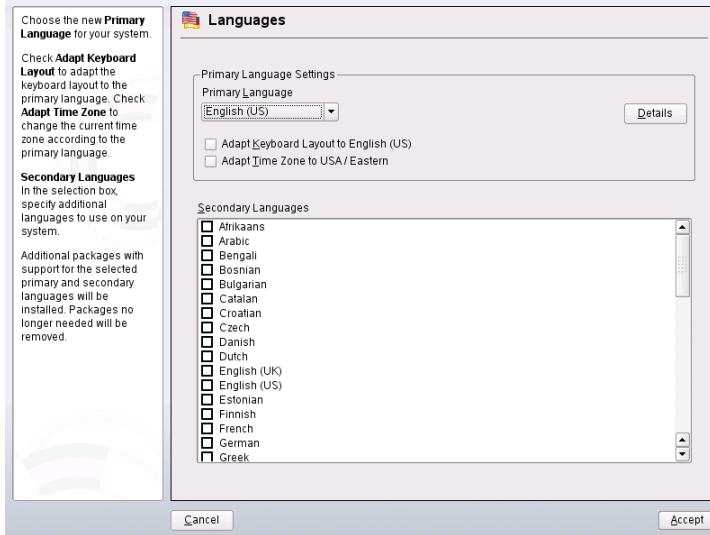

Primary Language

The primary language set in YaST applies to the entire system, including YaST and the desktop environment. This language is used whenever available unless you manually specify another language.

Secondary Languages

Secondary languages are languages selected manually for a specific situation. For example, use a secondary language to start an application in a certain language, for example, to do word processing in this language.

Figure 6.1 *Setting the Language*

To install an additional language, proceed as follows:

- 1** As `root`, start YaST.
- 2** Select *System > Language*.
- 3** Select the desired languages from the list of languages offered in *Secondary Languages*. When you leave this dialog with *Ok*, YaST installs the additional localized software packages. The system is multilingual, but you need to set the desired language explicitly to start an application in a language other than the primary one.
- 4** To make this language the default (the primary language), select it under *Primary Language*:
 - 4a** Adapt the keyboard to the new primary language and adjust the time zone, if appropriate.
 - 4b** Select *Details* to change language settings specific to `root` and to determine the exact locale:

Locale Settings for User root

`ctype` only adjusts the `LC_TYPE` variable in `/etc/sysconfig/language` for `root`, which sets the localization for language-specific function calls. `yes` sets the language for `root` to the same as the language for local users. `no` means the language settings for `root` are not affected by language changes. All `locale` values remain unset.

Use UTF-8 Encoding

Disable this box, if you do not want to use UTF-8 encoding for `root`.

Detailed Locale Setting

If your locale was not included in the list of primary languages available, try explicitly specifying it here. However, some of these localizations may be incomplete.

- 5 Leave this dialog and apply your settings with *Ok*.

6.1.2 Switching the System Language

Switching the system language is similar to installing additional languages. Use the YaST language module to change the primary language and to adjust keyboard and time zone. Once YaST has applied your changes and any open X sessions have been restarted, YaST, applications, and the desktop reflect your new language settings.

6.2 Changing the Country and Time Settings

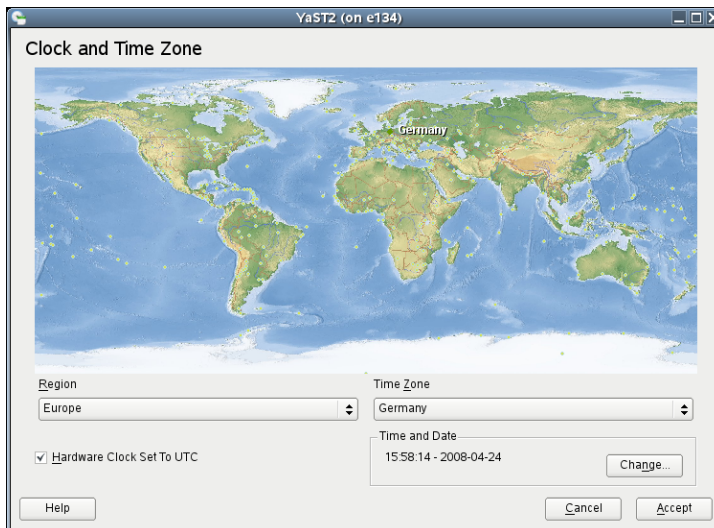

Using the YaST date and time module, adjust your system date, clock and time zone information to the area you are working in. First, select a general region, such as *Europe*, for example. Choose an appropriate time zone that matches the one you are working in, for example, *Germany*.

Depending on which operating systems run on your workstation, adjust the hardware clock settings, accordingly:

- If you run another operating system on your machine, such as Microsoft Windows*, it is likely your system does not use UTC, but local time. In this case, uncheck *Hardware Clock Set To UTC*.
- If you only run Linux on your machine, set the hardware clock to UTC and have the switch from standard time to daylight saving time performed automatically.

You can change the date and time manually or opt for synchronizing your machine against an NTP server, either permanently or just for adjusting your hardware clock. If you want to set date and time manually, proceed as follows:

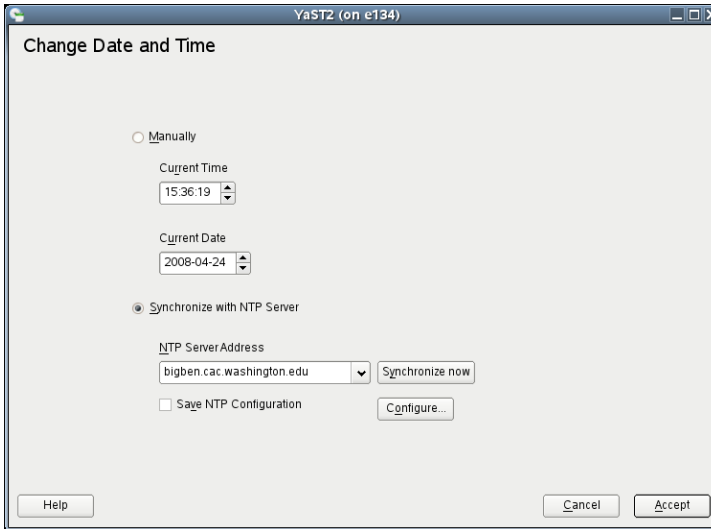

Figure 6.2 *Setting Country and Time*

- 1 Click *Change* to set date and time.
- 2 Select *Manually* and enter date and time values.
- 3 Confirm with *Accept*.

If you want to make use of an NTP server:

Figure 6.3 *Setting Date and Time With NTP Server*

- 1 Click *Change* to set date and time.
- 2 Select *Synchronize with NTP Server*.
- 3 Enter the address of an NTP server, if not prefilled.
- 4 Press *Synchronize Now*, to get your system time set correctly. If you want to make use of NTP permanently, enable *Save NTP Configuration*.
- 5 Confirm with *Accept*.

With the *Configure* button, you can also open the advanced NTP configuration. For details, see Section “Configuring an NTP Client with YaST” (Chapter 24, *Time Synchronization with NTP*, ↑Reference).

Part II. Basics

Basic Concepts

If this is your first encounter with a Linux system you probably want to learn something about the basic concepts of Linux before getting started. The graphical user interfaces of Linux, Mac OS* and Windows* show rather similar desktop components which makes it easy to move from one graphical environment to the next. However, if you take a look at the underlying system you will soon notice some differences.

The following sections are meant to guide you through the first steps with your Linux system and to help Linux “newbies” to orientate themselves in their new operating system. You will learn about the user concept of Linux, the structure of the Linux file system (where to find what in the directory tree) and how to deal with access permissions for files and directories which are an essential feature in Linux.

Users who have been working with Mac OS will probably recognize that the concepts explained in the following sections are rather similar to what they know already from Mac OS. Windows users may realize some crucial differences which are worth noticing.

7.1 User Concept

From the beginning, Linux has been designed as a multiuser system: Any number of users can simultaneously work on one machine. These users can connect to the system via different terminals or network connections. Usually users need to log in to the system before starting a session. Personal information and individual desktop configuration are stored separately for any user.

7.1.1 Distinct User Roles

Among the users working on a machine, Linux distinguishes between different kinds of user roles: you can log in to a Linux machine as “normal” user or as superuser (administrator), traditionally called `root` in Linux. The superuser has privileges which authorize him to access all parts of the system and to execute administrative tasks: He has the unrestricted capacity to make changes to the system and has unlimited access to all files. If you are logged in as a normal user you lack these privileges. User and `root` can of course be the same physical person but acting in different roles.

The `root` user account is always created on your Linux system by default — during installation you are therefore requested to specify a password for `root`. Which other users can log in to your system depends on the method of authentication you choose during installation (see [Section 1.11, “Create New User”](#) (page 21)).

For your daily work, you usually log in to your system as normal user. Performing some administrative tasks or running certain programs such as YaST require `root` permissions. You can easily switch from your normal account to `root` and back to your normal user account after accomplishing the administrative task. How to do so in a shell is described in [Section 8.4, “Becoming Root”](#) (page 111). If you are working with a graphical user interface you are usually prompted to enter the `root` password when necessary. Closing the application which required `root` permissions results in withdrawal of the `root` privileges: you automatically switch back to your normal user account.

While this concept might not look very appealing at first, it adds to security. A user without `root` privileges cannot damage the entire system. Any damage caused is strictly limited to the user's own account and data. Any operation executed with `root` privileges may potentially harm the entire system. Anyone intending to harm a running Linux system must gain `root` privileges first. This is why it is much harder to create viruses for Linux systems. They must overcome the root barrier first.

7.1.2 Groups

Every user in a Linux system belongs to at least to one group. A group, in this case, can be defined as a set of connected users with certain collective privileges. Groups are usually defined according to functional roles or the data and resources the members of the group need to access. When a new user account is created on your system, the user is usually assigned to a default, primary group. The system administrator can change this primary group or assign the user to an additional group, if necessary.

- ftp

7.2 The Linux File System

All users including the superuser have their own home directories where all private data, like documents, bookmarks, or e-mail, are stored. System directories holding central configuration files or executable files can only be modified by the superuser.

Read more about access permissions and how to modify them according to your needs in [Section 8.5, “Modifying File Permissions”](#) (page 112).

In Linux, you can choose whether you want to manage files and folders with a file manager or if you rather like to use the command line which is the traditional way. The last-mentioned method is often faster but requires some deeper knowledge of several commands to list, create, delete, or edit files and their properties. For more information about commands for manipulating files refer to [Section 8.3, “Working with Files and Directories”](#) (page 107). A file manager provides a graphical and more intuitive way to handle these tasks. Learn more about the file managers of GNOME and KDE in Section “Managing Folders and Files with Nautilus” (Chapter 1, *Getting Started with the GNOME Desktop*, ↑GNOME User Guide) and Section “Using Dolphin File Manager” (Chapter 2, *Working with Your Desktop*, ↑KDE User Guide). Whatever method you choose: The following sections provide you with some basic knowledge of the file system and provide an overview of the default directory structure in Linux.

7.2.1 Key Features

In Linux, all files and directories are located in a tree-like structure. The topmost directory is referred to as the file system *root* or just `/` (not to be confused with the `root` user). The counterpart of `/` in a Windows system would probably be `C:\`. All other directories in Linux can be accessed from the root directory and are arranged in a hierarchical structure.

Find the key features of the Linux file system in the following list which also highlights some of the major differences between the Linux and the Windows/DOS file system:

Specifying Paths

As opposed to Windows, Linux does not use backslashes to separate the components of a pathname, it uses slashes instead. For example, the private data of users in Windows may be stored under `C:\My Documents\Letters`, whereas in Linux it would be stored under `/home/username/Letters`.

Partitions, Drives/Devices and Directories

Linux does not use drive letters as Windows does. From the mere appearance of a pathname in Linux you can not tell whether you are addressing a partition, a drive/device, a network device or an “ordinary” directory.

Mounting and Unmounting

Another crucial difference between Windows/DOS and Linux is the concept of *mounting* and *unmounting* partitions, drives or directories. Windows detects partitions and drives during the boot process and assigns a drive letter to them. In Linux however, partitions or devices are usually not visible in the directory tree unless they are *mounted*, that means integrated into the file system at a specific location in the directory tree. As a normal user you cannot access data on a partition or a device unless it is mounted. But don't worry—most of the times you do not have to mount partitions or devices manually. During the installation of your system, you can define partitions to be mounted automatically when the system is started. Removable devices are usually also detected and mounted automatically by your system—the desktop environments such as KDE or GNOME will inform you about the appearance of a new device.

Figure 7.2 *Autodetection of a USB Stick in KDE*

Although this concept of mounting and unmounting may appear complicated or cumbersome at first sight this also offers great flexibility: for example you can easily mount a directory from a another machine over the network and act on that directory as though it were located on your local machine.

Case-Sensitivity

Linux distinguishes between uppercase and lowercase letters in the file system. For example, whether you name a file `test.txt`, `TeSt.txt` or `Test.txt` make a difference in Linux. This also holds true for directories: You cannot access a directory named `Letters` by the name `letters`.

File Extensions

As opposed to Windows, files in Linux *may* have a file extension, such as `.txt`, but do not need to have one. When you start working with the shell this sometimes makes it difficult for beginners to differentiate between files and folders, depending on the command you use to list the contents of a directory. Learn more about some basic shell commands in [Chapter 8, *Shell Basics*](#) (page 101). If you use the graphical file managers in GNOME or KDE (see Section “Managing Folders and Files with Nautilus” (Chapter 1, *Getting Started with the GNOME Desktop*, ↑GNOME User Guide) and Section “Using Dolphin File Manager” (Chapter 2, *Working with Your Desktop*, ↑KDE User Guide)) files and folders are symbolized by various different icons depending on the view you choose.

Figure 7.3 *File and Folders in KDE File Manager*

Hidden Files

Similar to Windows, Linux also distinguishes between “normal” files and *hidden files* which are often configuration files that you usually do not want to access or see as a normal user. In Linux, hidden files are indicated by a dot in front (for example, `.hiddenfile`). In order to access hidden files you can switch view in the file managers as described in Section “Using Dolphin File Manager” (Chapter 2, *Working with Your Desktop*, ↑KDE User Guide) or use a certain command in the shell as described in [Section 8.2.2, “Using Commands with Options”](#) (page 104).

File System Permissions

Because Linux is a multiuser system, every file in a Linux file system belongs to a user and a group. Only the owner of a file or directory (or, of course, `root`) can grant other users access permission to it. Linux basically distinguishes between three different types of access permissions: write permission, read permission and execute permission. You can only access a file or a folder if you have at least read permission to it. There are several ways to change the access permissions of files and folders: either traditionally via the shell or with the help of your desktop's file manager (see Section “Using Dolphin File Manager” (Chapter 2, *Working with Your Desktop*, ↑KDE User Guide)). If you have `root` privileges, you can also change the owner and the group of a file or folder. Read how to do so in a shell in [Section 8.5, “Modifying File Permissions”](#) (page 112).

For more detailed information about file system permissions refer to [Section 7.3, “File Access Permissions”](#) (page 97). Apart from the traditional permission concept for file system objects there are also extensions available which handle permissions more flexibly. Read more in Chapter 18, *Access Control Lists in Linux* (↑Reference).

7.2.2 The Directory Structure

The following table provides a short overview of the most important higher-level directories you find on a Linux system. Find more detailed information about the directories and important subdirectories in the following list.

Table 7.1 *Overview of a Standard Directory Tree*

Directory	Contents
/	Root directory—the starting point of the directory tree.
/bin	Essential binary files, such as commands that are needed by both the system administrator and normal users. Usually also contains the shells, such as Bash.
/boot	Static files of the boot loader.
/dev	Files needed to access host-specific devices.

Directory	Contents
<code>/etc</code>	Host-specific system configuration files.
<code>/home</code>	Holds the home directories of all users who have an account on the system. Only <code>root</code> 's home directory is not located in <code>/home</code> but in <code>/root</code> .
<code>/lib</code>	Essential shared libraries and kernel modules.
<code>/media</code>	Mount points for removable media.
<code>/mnt</code>	Mount point for temporarily mounting a file system.
<code>/opt</code>	Add-on application software packages.
<code>/root</code>	Home directory for the superuser <code>root</code> .
<code>/sbin</code>	Essential system binaries.
<code>/srv</code>	Data for services provided by the system.
<code>/tmp</code>	Temporary files.
<code>/usr</code>	Secondary hierarchy with read-only data.
<code>/var</code>	Variable data such as log files.
<code>/windows</code>	Only available if you have both Microsoft Windows* and Linux installed on your system. Contains the Windows data.

The following list provides more detailed information and gives some examples which files and subdirectories can be found in the directories:

`/bin`

Contains the basic shell commands that may be used both by `root` and by other users. These commands include `ls`, `mkdir`, `cp`, `mv`, `rm`, and `rmdir`. `/bin` also contains `Bash`, the default shell in openSUSE.

`/boot`

Contains data required for booting, such as the boot loader, the kernel, and other data that is used before the kernel begins executing user mode programs.

`/dev`

Holds device files that represent hardware components.

`/etc`

Contains local configuration files that control the operation of programs like the X Window System. The `/etc/init.d` subdirectory contains scripts that are executed during the boot process.

`/home/username`

Holds the private data of every user who has an account on the system. The files located here can only be modified by their owner or by the system administrator. By default, your e-mail directory and personal desktop configuration are located here in form of hidden files and directories. KDE users find the personal configuration data for their desktop in `.kde` or `.kde4` respectively, GNOME users find it in `.gconf`. For information about hidden files, refer to [Section 7.2.1, “Key Features”](#) (page 90).

NOTE: Home Directory in a Network Environment

If you are working in a network environment, your home directory may be mapped to a directory in the file system other than `/home`.

`/lib`

Contains essential shared libraries needed to boot the system and to run the commands in the root file system. The Windows equivalent for shared libraries are `DLL` files.

`/media`

Contains mount points for removable media, such as `CD-ROMs`, `USB sticks`, and `digital cameras` (if they use `USB`). `/media` generally holds any type of drive except

the hard drive of your system. As soon as your removable medium has been inserted or connected to the system and has been mounted, you can access it from here.

`/mnt`

This directory provides a mount point for a temporarily mounted file system. `root` may mount file systems here.

`/opt`

Reserved for the installation of additional software. Optional software and larger add-on program packages can be found there. KDE3 is located there, whereas KDE4 and GNOME have moved to `/usr` now.

`/root`

Home directory for the `root` user. Personal data of `root` is located here.

`/sbin`

As the `s` indicates, this directory holds utilities for the superuser. `/sbin` contains binaries essential for booting, restoring, and recovering the system in addition to the binaries in `/bin`.

`/srv`

Holds data for services provided by the system, such as FTP and HTTP.

`/tmp`

This directory is used by programs that require temporary storage of files.

`/usr`

`/usr` has nothing to do with users, but is the acronym for UNIX system resources. The data in `/usr` is static, read-only data that can be shared among various hosts compliant to the Filesystem Hierarchy Standard (FHS). This directory contains all application programs and establishes a secondary hierarchy in the file system. KDE4 and GNOME are also located here. `/usr` holds a number of subdirectories, such as `/usr/bin`, `/usr/sbin`, `/usr/local`, and `/usr/share/doc`.

`/usr/bin`

Contains generally accessible programs.

`/usr/sbin`

Contains programs reserved for the system administrator, such as repair functions.

`/usr/local`

In this directory, the system administrator can install local, distribution-independent extensions.

`/usr/share/doc`

Holds various documentation files and the release notes for your system. In the `manual` subdirectory, find an online version of this manual. If more than one language is installed, this directory may contain versions of the manuals for different languages.

Under `packages`, find the documentation included in the software packages installed on your system. For every package, a subdirectory `/usr/share/doc/packages/packagename` is created that often holds README files for the package and sometimes examples, configuration files, or additional scripts.

If HOWTOs are installed on your system `/usr/share/doc` also holds the `howto` subdirectory in which to find additional documentation on many tasks relating to the setup and operation of Linux software.

`/var`

Whereas `/usr` holds static, read-only data, `/var` is for data which is written during system operation and thus is variable data, such as log files or spooling data. For example, the log files of your system are in `/var/log/messages` (only accessible for `root`).

`/windows`

Only available if you have both Microsoft Windows and Linux installed on your system. Contains the Windows data available on the Windows partition of your system. Whether you can edit the data in this directory depends on the file system your Windows partition uses. If it is FAT32, you can open and edit the files in this directory. For an NTFS file system, however, you can only read your Windows files from Linux, but not modify them. Learn more in [Section 11.3, “Accessing Files on Different OS on the Same Computer”](#) (page 166).

7.3 File Access Permissions

In Linux, objects such as files or folder or processes generally belong to the user who created or initiated them. There are some exceptions from this rule. For more information

about the exceptions, refer to Chapter 18, *Access Control Lists in Linux* (↑Reference). The group which is associated with a file or a folder depends on the primary group the user belongs to when creating the object.

When you create a new file or directory, initial access permissions for this object are set according to a predefined scheme. As an owner of a file or directory, you can change the access permissions to this object. For example, you can protect files holding sensitive data against read access by other users and you can authorize the members of your group or other users to write, read, or execute several of your files where appropriate. As `root`, you can also change the ownership of files or folders.

7.3.1 Permissions for User, Group and Others

Three permission sets are defined for each file object on a Linux system. These sets include the read, write, and execute permissions for each of three types of users—the owner, the group, and other users. You can view and change the access permissions of a file or folder in the file managers of your desktop, as described in Section “Using Dolphin File Manager” (Chapter 2, *Working with Your Desktop*, ↑KDE User Guide) or in a shell (see [Section 8.5, “Modifying File Permissions”](#) (page 112)).

Figure 7.4 *File Access Permissions in KDE File Manager*

The following example shows the output of an `ls -l` command in a shell. This command lists the contents of a directory and shows the details for each file and folder in that directory.

Example 7.1 *Access Permissions For Files and Folders*

```
-rw-r----- 1 tux users      0 2006-06-23 16:08 checklist.txt
-rw-r--r--  1 tux users  53279 2006-06-21 13:16 gnome_quick.xml
-rw-rw----  1 tux users      0 2006-06-23 16:08 index.htm
-rw-r--r--  1 tux users  70733 2006-06-21 09:35 kde-start.xml
-rw-r--r--  1 tux users  47896 2006-06-21 09:46 kde_quick.xml
drwxr-xr-x  2 tux users     48 2006-06-23 16:09 local
-r-xr-xr-x  1 tux users 624398 2006-06-23 15:43 tux.jpg
```

As shown in the third column, all objects belong to user `tux`. They are assigned to the group `users` which is the primary group the user `tux` belongs to. To retrieve the access permissions the first column of the list must be examined more closely. Let's have a look at the file `kde-start.xml`:

Type	User Permissions	Group Permissions	Permissions for Others
-	rw-	r--	r--

The first column of the list consists of one leading character followed by nine characters grouped in three blocks. The leading character indicates the file type of the object : in this case, the hyphen (-) shows that `kde-start.xml` is a file. If you find the character `d` instead, this shows that the object is a directory (like `local` in the example above). The next three blocks show the access permissions for the owner, the group and other users (from left to right). Each block follows the same pattern: the first position shows read permissions (`r`), the next position shows write permissions (`w`), the last one shows execute permission (`x`). A lack of either permission is indicated by `-`. In our example, the owner of `kde-start.xml` has read and write access to the file but cannot execute it. The `users` group can read the file but cannot write or execute it. The same holds true for the other users as shown by the third block of characters.

7.3.2 Files and Folders

Access permissions have a slightly different impact depending on the type of object they apply to: file or directory. The following table shows the details:

Table 7.2 *Access Permissions For Files And Directories*

Access Permission	File	Folder
Read (r)	Users can open and read the file.	Users can view the contents of the directory. Without this permission, users cannot list the contents of this directory with <code>ls -l</code> , for example. However, if they only have execute permission for the directory, they can nevertheless access certain files in this directory if they know of their existence.
Write (w)	Users can change the file: They can add or drop data and can even delete the contents of the file. However, this does not include the permission to remove the file completely from the directory as long as they do not have write permissions for the directory where the file is located.	Users can create, rename or delete files in the directory.
Execute (x)	Users can execute the file. This permission is only relevant for files like programs or shell scripts, not for text files. If the operating system can execute the file directly, users do not need read permission to execute the file. However, if the file must be interpreted like a shell script or a perl program, additional read permission is needed.	Users can change into the directory and execute files there. If they do not have read access to that directory they cannot list the files but can access them nevertheless if they know of their existence.

Note that access to a certain file is always dependent on the correct combination of access permissions for the file itself *and* the directory it is located in.

Shell Basics

When working with Linux nowadays, you can communicate with the system nearly without ever requiring a command line interpreter (the shell). After booting your Linux system, you are usually directed to a graphical user interface that guides you through the login process and the following interactions with the operating system. The graphical user interface in Linux (the X Window System or X11) is initially configured during installation. Both KDE and GNOME desktop and other window managers you can install use it for interaction with the user.

Nevertheless it is useful to have some basic knowledge of working with a shell because you might encounter situations where the graphical user interface is not available—for example, if some problem with the X Window System occurs. If you are not familiar with a shell, you might feel a bit uncomfortable at first when entering commands, but the more you get used to it, the more you will realize that the command line is often the quickest and easiest way to perform some daily tasks.

For UNIX or Linux several shells are available which differ slightly in behavior and in the commands they accept. The default shell in openSUSE® is Bash (GNU Bourne-Again Shell).

The following sections will guide you through your first steps with the Bash shell and will show you how to complete some basic tasks via the command line. If you are interested in learning more or rather feel like a shell “power user” already, refer to

8.1 Starting a Shell

Basically, there are two different ways to start a shell from the graphical user interface which usually shows after you have booted your computer:

- you can leave the graphical user interface or
- you can start a terminal window *within* the graphical user interface.

While the first option is always available, you can only make use of the second option when you are logged in to a desktop such as KDE or GNOME already. Whichever way you choose: there is always a way back and you can switch back and forth between the shell and the graphical user interface.

If you want to give it a try, press `Ctrl + Alt + F2` to leave the graphical user interface. The graphical user interface disappears and you are taken to a shell which prompts you to log in. Type your username and press `Enter`. Then type your password and press `Enter`. The prompt now changes and shows some useful information as in the following example:

```
❶   ❷   ❸  
tux@linux:~>
```

- ❶ Your login.
- ❷ The hostname of your computer.
- ❸ Path to the current directory. Directly after login, the current directory usually is your home directory, indicated by the tilde symbol, `~`.

When you are logged in at a remote computer the information provided by the prompt always shows you which system you are currently working on.

When the cursor is located behind this prompt, you can pass on commands directly to your computer system. For example, you can now enter `ls -l` to list the contents of the current directory in a detailed format. If this is enough for your first encounter with the shell and you want to go back to the graphical user interface you should log out from your shell session first. To do so, type `exit` and press `Enter`. Then press `Alt + F7` to switch back to the graphical user interface. You will find your desktop and the applications running on it unchanged.

When you are already logged in to the GNOME or the KDE desktop and want to start a terminal window within the desktop, press `Alt + F2` and enter `konsole` (for KDE) or `gnome-terminal` (for GNOME). This opens a terminal window on your desktop. As you are already logged in to your desktop the prompt shows information about your system as described above. You can now enter commands and execute tasks just like in any shell which runs parallel to your desktop. To switch to another application on the desktop just click on the corresponding application window or select it from the taskbar of your panel. To close the terminal window press `Alt + F4`.

8.2 Entering Commands

As soon as the prompt appears on the shell it is ready to receive and execute commands. A command can consist of several elements. The first element is the actual command, followed by parameters or options. You can type a command and edit it by using the following keys: `←`, `→`, `Home`, `End`, `←` (Backspace), `Del`, and `Space`. You can correct typing errors or add options. The command is not executed until you press `Enter`.

IMPORTANT: No News Is Good News

The shell is not verbose: in contrast to some graphical user interfaces, it usually does not provide confirmation messages when commands have been executed. Messages only appear in case of problems or errors—or if you explicitly ask for them by executing a command with a certain option.

Also keep this in mind for commands to delete objects. Before entering a command like `rm` (without any option) for removing a file, you should know if you really want to get rid of the object: it will be deleted irretrievably, without inquiry.

8.2.1 Using Commands without Options

In [Section 7.3.1, “Permissions for User, Group and Others”](#) (page 98) you already got to know one of the most basic commands: `ls`, which used to list the contents of a directory. This command can be used with or without options. Entering the plain `ls` command shows the contents of the current directory:

```
tux@knox:~> ls
bin Desktop Documents public_html tux.txt
tux@knox:~>
```

As you already learned in [Section 7.2.1, “Key Features”](#) (page 90) files in Linux may have a file extension or a suffix, such as `.txt`, but do not need to have one. This makes it difficult to differentiate between files and folders in this output of the `ls`. By default, the colors in the Bash shell give you a hint: directories are usually shown in blue, files in black.

8.2.2 Using Commands with Options

A better way to get more details about the contents of a directory is using the `ls` command with a string of options. Options modify the way a command works so that you can get it to carry out specific tasks. Options are separated from the command with a blank and are usually prefixed with a hyphen. The `ls -l` command shows the contents of the same directory in full detail (long listing format):

```
tux@knox:~> ls -l
drwxr-xr-x 1 tux users      48 2006-06-23 16:08 bin
drwx---r-- 1 tux users  53279 2006-06-21 13:16 Desktop
drwx----- 1 tux users    280 2006-06-23 16:08 Documents
drwxr-xr-x 1 tux users  70733 2006-06-21 09:35 public_html
-rw-r--r-- 1 tux users  47896 2006-06-21 09:46 tux.txt
tux@knox:~>
```

This output shows the following information about each object:

```
drwxr-xr-x❶ 1❷ tux❸ users❹ 48❺ 2006-06-23 16:08❻ bin❼
```

- ❶ Type of object and access permissions. For further information, refer to [Section 7.3.1, “Permissions for User, Group and Others”](#) (page 98).
- ❷ Number of hard links to this file.
- ❸ Owner of the file or directory. For further information, refer to [Section 7.3.1, “Permissions for User, Group and Others”](#) (page 98).
- ❹ Group assigned to the file or directory. For further information, refer to [Section 7.3.1, “Permissions for User, Group and Others”](#) (page 98).
- ❺ File size in bytes.
- ❻ Date and time of the last change.
- ❼ Name of the object.

Usually, you can combine several options by prefixing only the first option with a hyphen and then write the others consecutively without a blank. For example, if you want to see all files in a directory in long listing format, you can combine the two options `-l` and `-a` (show all files) for the `ls` command. Executing `ls -la` shows also hidden files in the directory, indicated by a dot in front (for example, `.hiddenfile`).

The list of contents you get with `ls` is sorted alphabetically by filenames. But like in a graphical file manager, you can also sort the output of `ls -l` according to various criteria such as date, file extension or file size:

- For date and time, use `ls -lt` (displays newest first).
- For extensions, use `ls -lx` (displays files with no extension first).
- For file size, use `ls -lS` (displays largest first).

To revert the order of sorting, add `-r` as an option to your `ls` command. For example, `ls -lr` gives you the contents list sorted in reverse alphabetical order, `ls -ltr` shows the oldest files first. There are lots of other useful options for `ls`—in the following section you will learn how to investigate them.

8.2.3 Getting Help

Nobody is expected to know all options of all commands by heart. If you remember the command name but are not sure about the options or the syntax of the command, choose one of the following possibilities:

`--help` option

If you only want to look up the options of a certain command, try entering the command followed by a blank and `--help`. This `--help` option exists for many commands. For example, `ls --help` displays all the options for the `ls` command.

Manual Pages

To learn more about the various commands, you can also use the manual pages. Manual pages also give a short description of what the command does. They can be accessed with `man` followed by the name of the command, for example, `man ls`.

The man pages are displayed directly in the shell. To navigate them, move up and down with **Page ↑** and **Page ↓**. Move between the beginning and the end of a document with **Home** and **End**. End this viewing mode by pressing **Q**. Learn more about the `man` command itself with `man man`.

Info Pages

Info pages usually provide even more information about commands. To view the info page for a certain command, enter `info` followed by the name of the command, for example, `info ls`. You can browse an info page with a viewer directly in the shell and display the different sections, called “nodes.” Use **Space** to move forward and **<—** to move backwards. Within a node, you can also browse with **Page ↑** and **Page ↓** but only **Space** and **<—** will take you also to the previous or subsequent node. Like for the man pages, press **Q** to end the viewing mode.

Note that man pages and info pages do not exist for all commands: sometimes both are available (usually for key commands), sometimes only a man page or an info page exists, sometimes neither of them.

8.2.4 Bash Shortcut Keys

When having entered several commands, your shell will soon be filled with all sorts of commands and the corresponding outputs. In the following table, find some useful shortcut keys for navigating and editing in the shell which help you to keep overview.

Shortcut Key	Function
Ctrl + L	Clears the screen and moves the current line to the top of the page.
Ctrl + C	Aborts the command which is currently being executed.
Shift + Page ↑	Scroll upwards.
Shift + Page ↓	Scroll downwards.
Ctrl + U	Delete from cursor position to start of line.

Shortcut Key	Function
Ctrl + K	Delete from cursor position to the end of line.
Ctrl + D	Closes the shell session.
↑, ↓	Browse in the history of executed commands.

8.3 Working with Files and Directories

To address a certain file or directory, you must specify the path leading to that directory or file. As you may know from MS DOS or Mac OS already, there are two ways to specify a path:

Absolute Path

Enter the entire path from the root directory to the respective file or directory.

Relative Path

Enter a path to the respective file or directory by using the current directory as a starting point. This implies to give the levels you have to move up or down in the file system tree to reach the target directory of file, starting from the current directory.

Paths contain filenames, directories or both, separated by slashes. Absolute paths always start with a slash. Relative paths do not have a slash at the beginning, but can have one or two dots.

When entering commands, you can choose either way to specify a path—depending on your preferences or the amount of typing—both will lead to the same result. To change directories, use the `cd` command and specify the path to the directory.

NOTE: Handling Blanks in Filenames or Directory Names

If a filename or the name of a directory contains a space, either escape the space using a back slash (`\`) in front of the blank or enclose the filename in single quotes. Otherwise Bash interprets a filename like `My Documents` as the names of two files or directories, `My` and `Documents` in this case.

When specifying paths, the following “shortcuts” can save you a lot of typing:

- The tilde symbol (~) is a shortcut for home directories. For example, to list the contents of your home directory, use `ls ~`. To list the contents of another user's home directory, enter `ls ~username` (or course, this will only work if you have permission to view the contents, see [Section 7.3, “File Access Permissions”](#) (page 97)). For example, entering `ls ~tux` would list the contents of the home directory of a user named `tux`. You can use the tilde symbol as shortcut for home directories also if you are working in a network environment and where your home directory may not be called `/home` but can be mapped to any directory in the file system.

From anywhere in the file system, you can reach your home directory by entering `cd ~` or even shorter, by simply entering `cd` without any options.

- When using relative paths, refer to the current directory with a dot (`.`). This is mainly useful for commands such as `cp` or `mv` by which you can copy or move files or directories.
- The next higher level in the tree is represented by two dots (`..`). In order to switch to the parent directory of your current directory, enter `cd ..`, to go up two levels from the current directory enter `cd ../..` etc.

To apply your knowledge, find some examples below. They address basic tasks you may want to execute with files or folders using Bash.

8.3.1 Examples for Working with Files and Directories

Suppose you want to copy a file located somewhere in your home directory to a sub-directory of `/tmp`.

- 1 First, from your home directory create a subdirectory in `/tmp`:

1a Enter

```
mkdir /tmp/test
```

`mkdir` stands for “make directory”. This command creates a new directory named `test` in the `/tmp` directory. In this case, you are using an absolute path to create the `test` directory.

1b To check what happened, now enter

```
ls -l /tmp
```

The new directory `test` should appear in the list of contents of the `/tmp` directory.

1c Switch to the newly created directory with

```
cd /tmp/test
```

2 Now create a new file in a subdirectory of your home directory and copy it to `/tmp/test`. Use a relative path for this task.

IMPORTANT: Overwriting of Existing Files

Before copying, moving or renaming a file, check if your target directory already contains a file with the same name. If yes, consider to change one of the filenames or use `cp` or `mv` with options like `-i` which will prompt before overwriting an existing file. Otherwise Bash will overwrite an existing file without inquiry.

2a To list the contents of your home directory, enter

```
ls -l ~
```

It should contain a subdirectory called `Documents` by default. If not, create this subdirectory with the `mkdir` command you already know:

```
mkdir ~/Documents
```

2b Enter

```
touch ~/Documents/myfile.txt
```

This command creates a new, empty file named `myfile.txt` in the `Documents` directory.

Usually, the `touch` command updates the modification and access date for an existing file. If you use `touch` with a filename which does not exist in your target directory, it creates a new file.

2c Enter

```
ls -l ~/Documents
```

The new file should appear in the list of contents.

2d Enter

```
cp ~/Documents/myfile.txt .
```

Do not forget the dot at the end.

This command tells Bash to go to your home directory and to copy `myfile.txt` from the `Documents` subdirectory to the current directory, `/tmp/test`, without changing the name of the file.

2e Check the result by entering

```
ls -l
```

The file `myfile.txt` should appear in the list of contents for `/tmp/test`.

Now suppose you want to rename `myfile.txt` into `tuxfile.txt`. Finally you decide to remove the renamed file and the `test` subdirectory.

1 To rename the file, enter

```
mv myfile.txt tuxfile.txt
```

2 To check what happened, enter

```
ls -l
```

Instead of `myfile.txt`, `tuxfile.txt` should appear in the list of contents.

`mv` stands for `move` and is used with two options: the first option specifies the source, the second option specifies the target of the operation. You can use `mv` either

- to rename a file or a directory,
- to move a file or directory to a new location or
- to do both in one step.

3 Coming to the conclusion that you do not need the file any longer, you can delete it by entering

```
rm tuxfile.txt
```

Bash deletes the file without any inquiry.

4 Move up one level with `cd ..` and check with

```
ls -l test
```

if the `test` directory is empty now.

5 If yes, you can remove the `test` directory by entering

```
rmdir test
```

8.4 Becoming Root

As you learned in [Section 7.1, “User Concept”](#) (page 87), some tasks in Linux require `root` permissions, otherwise they cannot be executed. In order to temporarily become `root` in a shell, proceed as follows:

- 1** Enter `su`. You are prompted for the `root` password.
- 2** Enter the password. If you mistyped the `root` password, the shell displays a message. In this case, you have to re-enter `su` before retyping the password. If your password is correct, a hash symbol `#` appears at the end of the prompt, signaling that you are acting as `root` now.
- 3** Execute your task. For example, transfer ownership of a file to a new user which only `root` is allowed to do:

```
chown wilber kde_quick.xml
```

- 4 After having completed your tasks as `root`, switch back to your normal user account. To do so, enter

```
exit
```

The hash symbol disappears and you are acting as “normal” user again.

Alternatively, you can also use `sudo` (superuser “do”) to execute some tasks which normally are for `roots` only. With `sudo`, administrators can grant certain users `root` privileges for some commands. Depending on the system configuration, users can then run `root` commands by entering their normal password only. Due to a timestamp function, users are only granted a “ticket” for a restricted period of time after having entered their password. The ticket usually expires after a few minutes. In openSUSE, `sudo` requires the `root` password by default (if not configured otherwise by your system administrator).

For users, `sudo` is comfortable as it prevents you from switching accounts twice (to `root` and back again). To change the ownership of a file using `sudo`, only one command is necessary instead of three:

```
sudo chown wilber kde_quick.xml
```

After you have entered the password which you are prompted for, the command is executed. If you enter a second `root` command shortly after that, you are not prompted for the password again, because your ticket is still valid. After a certain amount of time, the ticket automatically expires and the password is required again. This also prevents unauthorized persons from gaining `root` privileges in case a user forgets to switch back to his normal user account again and leaves a `root` shell open.

8.5 Modifying File Permissions

In Linux, objects such as files or folder or processes generally belong to the user who created or initiated them. The group which is associated with a file or a folder depends on the primary group the user belongs to when creating the object. When you create a new file or directory, initial access permissions for this object are set according to a predefined scheme. For further details refer to [Section 7.3, “File Access Permissions”](#) (page 97).

As the owner of a file or directory (and, of course, as `root`), you can change the access permissions to this object.

To change object attributes like access permissions of a file or folder, use the `chmod` command followed by the following parameters:

- the users for which to change the permissions,
- the type of access permission you want to remove, set or add and
- the files or folders for which you want to change permissions separated by spaces.

The users for which you can change file access permissions fall into the following categories: the owner of the file (user, `u`), the group that own the file (group, `g`) and the other users (others, `o`). You can add, remove or set one or more of the following permissions: read, write or execute.

As `root`, you can also change the ownership of a file: with the command `chown` (change owner) you can transfer ownership to a new user.

8.5.1 Examples for Changing Access Permissions and Ownership

The following example shows the output of an `ls -l` command in a shell.

Example 8.1 Access Permissions For Files and Folders

```
-rw-r----- 1 tux users      0 2006-06-23 16:08 checklist.txt
-rw-r--r--  1 tux users  53279 2006-06-21 13:16 gnome_quick.xml
-rw-rw----  1 tux users      0 2006-06-23 16:08 index.htm
-rw-r--r--  1 tux users  70733 2006-06-21 09:35 kde-start.xml
-rw-r--r--  1 tux users  47896 2006-06-21 09:46 kde_quick.xml
drwxr-xr-x  2 tux users     48 2006-06-23 16:09 local
-r-xr-xr-x  1 tux users 624398 2006-06-23 15:43 tux.jpg
```

In the example above, user `tux` owns the file `kde-start.xml` and has read and write access to the file but cannot execute it. The `users` group can read the file but cannot write or execute it. The same holds true for the other users as shown by the third block of characters.

Suppose you are `tux` and want to modify the access permissions to your files:

- 1** If you want to grant the `users` group also write access to `kde-start.xml`, enter

```
chmod g+w kde-start.xml
```

- 2** To grant the `users` group and other users write access to `kde-start.xml`, enter

```
chmod go+w kde-start.xml
```

- 3** To remove write access for all users, enter

```
chmod -w kde-start.xml
```

If you do not specify any kind of users, the changes apply to all users—the owner of the file, the owning group and the others. Now even the owner `tux` does not have write access to the file without first reestablishing write permissions.

- 4** To prohibit the `users` group and others to change into the directory `local`, enter

```
chmod go-x local
```

- 5** To grant others write permissions for two files, for `kde_quick.xml` and `gnome_quick.xml`, enter

```
chmod o+w kde_quick.xml gnome_quick.xml
```

Suppose you are `tux` and want to transfer the ownership of the file `kde_quick.xml` to an other user, named `wilber`. In this case, proceed as follows:

- 1** Enter the username and password for `root`.

- 2** Enter

```
chown wilber kde_quick.xml
```

- 3** Check what happened with

```
ls -l kde_quick.xml
```

You should get the following output:

```
-rw-r--r-- 1 wilber users 47896 2006-06-21 09:46 kde_quick.xml
```

- 4 If the ownership is set according to your wishes, switch back to your normal user account.

8.6 Useful Features of the Shell

As you probably noticed in the examples above, entering commands in Bash can include a lot of typing. In the following, get to know some features of the Bash that can make your work a lot easier and save a lot of typing.

History

By default, Bash “remembers” commands you have entered. This feature is called *history*. You can browse through commands that have been entered before, select one you want to repeat and then execute it again. To do so, press \uparrow repeatedly until the desired command appears at the prompt. To move forward through the list of previously entered commands, press \downarrow . For easier repetition of a certain command from Bash history, just type the first letter of the command you want to repeat and press Page \uparrow .

You can now edit the selected command (for example, change the name of a file or a path), before you execute the command by pressing Enter. To edit the command line, just move the cursor to the desired position using the arrow keys and start typing.

You can also search for a certain command in the history. Press $\text{Ctrl} + \text{R}$ to start an incremental search function. showing the following prompt:

```
(reverse-i-search)`':
```

Just type one or several letters from the command you are searching for. Each character you enter narrows down the search. The corresponding search result is shown on the right side of the colon whereas your input appears on the left of the colon. To accept a search result, press Esc. The prompt now changes to its normal appearance and shows the command you chose. You can now edit the command or directly execute it by pressing Enter.

Completion

Completing a filename or directory name to its full length after typing its first letters is another helpful feature of Bash. To do so, type the first letters then press \rightarrow | (Tabulator). If the filename or path can be uniquely identified, it is completed at once and the cursor moves to the end of the filename. You can then enter the next

option of the command, if necessary. If the filename or path cannot be uniquely identified (because there are several filenames starting with the same letters), the filename or path is only completed up to the point where it is getting ambiguous again. You can then obtain a list of them by pressing `→|` a second time. After this, you can enter the next letters of the file or path then try completion again by pressing `→|`. When completing filenames and paths with the help of `→|`, you can simultaneously check whether the file or path you want to enter really exists (and you can be sure of getting the spelling right).

Wild Cards

You can replace one or more characters in a filename with a wild card for pathname expansion. Wild cards are characters that can stand for other characters. There are three different types of these in Bash:

Wild Card	Function
<code>?</code>	Matches exactly one arbitrary character
<code>*</code>	Matches any number of characters
<code>[set]</code>	Matches one of the characters from the group specified inside the square brackets, which is represented here by the string <i>set</i> .

8.6.1 Examples For Using History, Completion and Wildcards

The following examples illustrate how to make use of these convenient features of Bash.

If you already did the example [Section 8.3.1, “Examples for Working with Files and Directories”](#) (page 108) your shell buffer should be filled with commands which you can retrieve using the history function.

- 1 Press `↑` repeatedly until `cd ~` appears.
- 2 Press `Enter` to execute the command and to switch to your home directory.

By default, your home directory contains two subdirectories starting with the same letter, `Documents` and `Desktop`.

- 3** Enter `cd D` and press `→|`.

Nothing happens since Bash cannot identify to which one of the subdirectories you want to change.

- 4** Press `→|` again to see the list of possible choices:

```
tux@knox:~> cd D Desktop/ Documents/ tux@knox:~> cd D
```

- 5** The prompt still shows your initial input. Type the next character of the subdirectory you want to go to and press `→|` again.

Bash now completes the path.

- 6** You can now execute the command with Enter.

Now suppose that your home directory contains a number of files with various file extensions. It also holds several versions of one file which you saved under different filenames `myfile1.txt`, `myfile2.txt` etc. You want to search for certain files according to their properties.

- 1** First, create some test files in your home directory:

- 1a** Use the `touch` command you already know to create several (empty) files with different file extensions, for example `.pdf`, `.xml` and `.jpg`.

You can do this consecutively (do not forget to use the Bash history function) or with only one `touch` command: simply add several filenames separated by a blank.

- 1b** Create at least two files that have the same file extension, for example `.html`.

- 1c** To create several “versions” of one file, enter

```
touch myfile{1..5}.txt
```

This command creates five consecutively numbered files:

```
myfile1.txt, ..., myfile5.txt
```

1d List the contents of your home directory. It should look similar to this:

```
-rw-r--r-- 1 tux users 0 2006-07-14 13:34 foo.xml
-rw-r--r-- 1 tux users 0 2006-07-14 13:47 home.html
-rw-r--r-- 1 tux users 0 2006-07-14 13:47 index.html
-rw-r--r-- 1 tux users 0 2006-07-14 13:47 toc.html
-rw-r--r-- 1 tux users 0 2006-07-14 13:34 manual.pdf
-rw-r--r-- 1 tux users 0 2006-07-14 13:49 myfile1.txt
-rw-r--r-- 1 tux users 0 2006-07-14 13:49 myfile2.txt
-rw-r--r-- 1 tux users 0 2006-07-14 13:49 myfile3.txt
-rw-r--r-- 1 tux users 0 2006-07-14 13:49 myfile4.txt
-rw-r--r-- 1 tux users 0 2006-07-14 13:49 myfile5.txt
-rw-r--r-- 1 tux users 0 2006-07-14 13:32 tux.png
```

2 With the help of wild cards, select certain subsets of the files according to various criteria:

2a To list all files with the `.html` extension, enter

```
ls -l *.html
```

2b To list all “versions” of `myfile.txt`, enter

```
ls -l myfile?.txt
```

Note that you can only use the `?` wild card here because the numbering of the files is single-digit. As soon as you also had a file named `myfile10.txt` you would have to use the `*` wild card to view all versions of `myfile.txt` (or add another question mark, so your string looks like `myfile??.txt`).

2c To remove, for example, version 1-3 and version 5 of `myfile.txt`, enter

```
rm myfile[1-3,5].txt
```

2d Check the result with

```
ls -l
```

Of all `myfile.txt` versions only `myfile4.txt` should be left.

Of course, you can also combine several wild cards in one command. In the example above, `rm myfile[1-3,5].*` would lead to the same result as `rm myfile[1-3,5].txt` because there are only files with the extension `.txt` available.

NOTE: Using Wildcards in rm Commands

Wildcards in a `rm` command can be very useful but also dangerous: you might delete more files from your directory than intended. To see which files would be affected by the `rm`, run your wildcard string with `ls` instead of `rm` first.

8.7 Editing Texts

In order to edit files from the command line, you will get to know the `vi` editor sooner or later. `vi` is a default editor which can be found on nearly every UNIX/Linux system. It can run several operating modes in which the keys you press have different functions. This does not make it very easy for beginners, but you should know at least the most basic operations with `vi`. There may be situations where no other editor than `vi` is available.

Basically, `vi` makes use of three operating modes:

command mode

In this mode, `vi` accepts certain key combinations as commands. Simple tasks such as searching words or deleting a line can be executed.

insert mode

In this mode, you can write normal text.

extended mode

This mode is also known as colon mode as you have to enter a colon to switch to this mode. In this mode, `vi` can execute also more complex tasks such as searching and replacing text.

In the following (very simple) example, you will learn how to open and edit a file with `vi`, how to save your changes and quit `vi`. For more information about `vi` and `vim` (an improved version of `vi`), refer to .

8.7.1 Example: Editing with vi

NOTE: Display of Keys

In the following, find several commands that you can enter in vi by just pressing keys. These appear in uppercase as on a keyboard. If you need to enter a key in uppercase, this is stated explicitly by showing a key combination including the Shift key.

- 1 To create and open a new file with vi, enter

```
vi textfile.txt
```

By default, vi opens in *command* mode in which you cannot enter text.

- 2 Press I to switch to insert mode. The bottom line changes and indicates that you now can insert text.
- 3 Write some sentences. If you want to insert a new line, first press Esc to switch back to command mode. Press O to insert a new line and to switch to insert mode again.
- 4 In the insert mode, you can edit the text with the arrow keys and with Del.
- 5 To leave vi, press Esc to switch to command mode again. Then press : which takes you to the extended mode. The bottom line now shows a colon.
- 6 To leave vi and save your changes, type wq (w for write; q for quit) and press Enter. If you want to save the file under a different name, type w *filename* and press Enter.

To leave vi without saving, type q! instead and press Enter.

8.8 Searching for Files or Contents

Bash offers you several commands to search for files and to search for contents of files:

`locate`

This utility is only available if you have installed the `findutils-locate` package. With this command you can find out in which directory a specified file is located. If desired, use wild cards to specify filenames. The program is very speedy, because it uses a database specifically created for the purpose (rather than searching through the entire file system). This very fact, however, also results in a major drawback: `locate` is unable to find any files created after the latest update of its database. The database can be generated by `root` running `updatedb`.

`find`

With `find`, search for a file in a given directory. The first argument specifies the directory in which to start the search. The option `-name` must be followed by a search string, which may also include wild cards. Unlike `locate`, which uses a database, `find` scans the actual directory.

`grep`

The `grep` command finds a specific search string in the specified text files. If the search string is found, the command displays the line in which `searchstring` was found along with the filename. If desired, use wild cards to specify filenames.

8.8.1 Examples for Searching

KDE and GNOME desktop store user-specific application data in hidden directories, for example `.kde` and `.gnome`.

- 1 To locate these directories on your computer, enter

```
locate .kde
```

if you have installed KDE desktop or

```
locate .gnome
```

if you have installed GNOME desktop.

You will see that `locate` displays all file names in the database that contain the string `.kde` or `.gnome` anywhere. To learn how to modify this behavior refer to the man page of `locate`.

- 2 To search your home directory for all occurrences of filenames that contain the file extension `.txt`, use

```
find ~ -name '*.txt' -print
```

- 3 To search a directory (in this case, your home directory) for all occurrences of files which contain, for example, the word `music`, enter

```
grep music ~/*
```

Note that `grep` is case-sensitive— unless you use it with the `-i` option. With the command above you will not find any files containing `Music`.

If you want to use a search string which consists of more than one word, enclose the string in double quotation marks, for example:

```
grep "music is great" ~/*
```

8.9 Viewing Text Files

When searching for the contents of a file with `grep` the output gives you the line in which the `searchstring` was found along with the filename. Often this contextual information is still not enough information to decide whether you want to open and edit this file. Bash offers you several commands to have a quick look at the contents of a text file directly in the shell, without opening an editor.

`head`

With `head` you can view the first lines of a text file. If you do not specify the command any further, `head` shows the first 10 lines of a text file.

`tail`

The `tail` command is the counterpart of `head`. If you use `tail` without any further options it displays the last 10 lines of a text file. This can be very useful to view log files of your system, where the most recent messages or log entries are usually found at the end of the file.

`less`

With `less`, display the whole contents of a text file. To move up and down half a page use `Page ↑` and `Page ↓`. Use `Space` to scroll down one page. `Home` takes you to the beginning, and `End` to the end of the document. To end the viewing mode, press `Q`.

`more`

Instead of `less`, you can also use the older program `more`. It has basically the same function—however, it is less convenient because it does not allow you to scroll backwards. Use `Space` to move forward. When you reach the end of the document, the viewer closes automatically.

`cat`

The `cat` command displays the contents of a file, printing the entire contents to the screen without interruption. As `cat` does not allow you to scroll it is not very useful as viewer but it is rather often used in combination with other commands.

8.10 Redirection and Pipes

Sometimes it would be useful if you could write the output of a command to a file for further editing or if you could combine several commands, using the output of one command as input for the next one. The shell offers this function by means of redirection or pipes.

Normally, the standard output in the shell is your screen (or an open shell window) and the standard input is the keyboard. With the help of certain symbols you can redirect the input or the output to another object, such as a file or another command.

Redirection

With `>` you can forward the output of a command to a file (output redirection), with `<` you can use a file as input for a command (input redirection).

Pipe

By means of a pipe symbol `|` you can also redirect the output: with a pipe, you can combine several commands, using the output of one command as input for the next command. In contrast to the other redirection symbols `>` and `<`, the use of the pipe is not constrained to files.

8.10.1 Examples for Redirection and Pipe

- 1 To write the output of a command like `ls` to a file, enter

```
ls -l > filelist.txt
```

This creates a file named `filelist.txt` that contains the list of contents of your current directory as generated by the `ls` command.

However, if a file named `filelist.txt` already exists, this command overwrites the existing file. To prevent this, use `>>` instead of `>`. Entering

```
ls -l >> filelist.txt
```

simply appends the output of the `ls` command to an already existing file named `filelist.txt`. If the file does not exist, it is created.

- 2 If a command generates a lengthy output, like `ls -l` may do, it often may be useful to pipe the output to a viewer like `less` to be able to scroll through the pages. To do so, enter

```
ls -l | less
```

The list of contents of the current directory is shown in `less`.

The pipe is also often used in combination with the `grep` command in order to search for a certain string in the output of another command. For example, if you want to view a list of files in a directory which are owned by a certain user, `tux`, enter

```
ls -l | grep tux
```

8.11 Handling Processes

As you have seen in [Section 8.7, “Editing Texts”](#) (page 119), programs can be started from the shell. Applications with a graphical user interface need the X Window System and can only be started from a terminal window within a graphical user interface. To open a file named `vacation.pdf` in your home directory from a terminal window in KDE or GNOME, simply run `xpdf ~/vacation.pdf` to start a PDF viewer displaying your file.

When looking at the terminal window again you will realize that the command line is blocked as long as the PDF viewer is open, meaning that your prompt is not available. To change this, press `Ctrl + Z` to suspend the process and enter `bg` to send the process to the background. Now you can still have a look at `vacation.pdf` while your prompt is available for further commands. An easier way to achieve this is by sending a process to the background directly when starting it. To do so, add an ampersand at the end of the command:

```
xpdf ~/vacation.pdf &
```

If you have started several background processes (also named jobs) from the same shell, the `jobs` command gives you an overview of the jobs (including the job number and their status):

```
tux@linux:~> jobs
[1]  Running          kpdf book.opensuse.startup-xep.pdf &
[2]-  Running          kpdf book.opensuse.reference-xep.pdf &
[3]+  Stopped          man jobs
```

To bring a job to the foreground again, enter `fg job number`.

Whereas `job` only shows the background processes started from a specific shell, the `ps` command (run without options) shows a list of all your processes—those you started. Find an example output below:

```
tux@linux:~> ps
PID TTY          TIME CMD
15500 pts/1        00:00:00 bash
28214 pts/1        00:00:00 xpdf
30187 pts/1        00:00:00 kate
30280 pts/1        00:00:00 ps
```

In case a program cannot be terminated in the normal way, use the `kill` command to stop the process (or processes) belonging to that program. To do so, specify the process ID (PID) shown by the output of `ps`. For example, to shut down the Kate editor in the example above, enter

```
kill 30187
```

This sends a `TERM` signal that instructs the program to shut itself down.

Alternatively, if the program or process you want to terminate is a background job and is shown by the `jobs` command, you can also use the `kill` command in combination with the job number to terminate this process:

```
kill % job number
```

If `kill` does not help—as is sometimes the case for “runaway” programs—try

```
kill -9 PID
```

This sends a *KILL* signal instead of a *TERM* signal, bringing the specified process to an end in most cases.

This section only aimed to introduce the most basic set of commands for handling jobs and processes. Find an overview for system administrators in Section “Processes” (Chapter 11, *System Monitoring Utilities*, ↑Reference).

8.12 Important Linux Commands

This section gives insight into the most important commands. There are many more commands than listed in this chapter. Along with the individual commands, parameters are listed and, where appropriate, a typical sample application is introduced. To learn more about the various commands, use the manual pages, accessed with `man` followed by the name of the command, for example, `man ls`.

Man pages are displayed directly in the shell. To navigate them, move up and down with `Page ↑` and `Page ↓`. Move between the beginning and the end of a document with `Home` and `End`. End this viewing mode by pressing `Q`. Learn more about the `man` command itself with `man man`.

In the following overview, the individual command elements are written in different typefaces. The actual command and its mandatory options are always printed as `command option`. Specifications or parameters that are not required are placed in [square brackets].

Adjust the settings to your needs. It makes no sense to write `ls file` if no file named `file` actually exists. You can usually combine several parameters, for example, by writing `ls -la` instead of `ls -l -a`.

8.12.1 File Commands

The following section lists the most important commands for file management. It covers anything from general file administration to manipulation of file system ACLs.

File Administration

`ls[options] [files]`

If you run `ls` without any additional parameters, the program lists the contents of the current directory in short form.

`-l`
Detailed list

`-a`
Displays hidden files

`cp[options]source target`

Copies source to target.

`-i`
Waits for confirmation, if necessary, before an existing target is overwritten

`-r`
Copies recursively (includes subdirectories)

`mv[options]source target`

Copies source to target then deletes the original source.

`-b`
Creates a backup copy of the source before moving

`-i`
Waits for confirmation, if necessary, before an existing targetfile is overwritten

`rm[options]files`

Removes the specified files from the file system. Directories are not removed by `rm` unless the option `-r` is used.

`-r`
Deletes any existing subdirectories

`-i`
Waits for confirmation before deleting each file

`ln[options]sourcetarget`

Creates an internal link from `source` to `target`. Normally, such a link points directly to `source` on the same file system. However, if `ln` is executed with the `-s` option, it creates a symbolic link that only points to the directory in which `source` is located, enabling linking across file systems.

`-s`

Creates a symbolic link

`cd[options] [directory]`

Changes the current directory. `cd` without any parameters changes to the user's home directory.

`mkdir[options]directory`

Creates a new directory.

`rmdir[options]directory`

Deletes the specified directory if it is already empty.

`chown[options] username[:[group]]files`

Transfers ownership of a file to the user with the specified username.

`-R`

Changes files and directories in all subdirectories

`chgrp[options]groupnamefiles`

Transfers the group ownership of a given `file` to the group with the specified group name. The file owner can only change group ownership if a member of both the current and the new group.

`chmod[options]modefiles`

Changes the access permissions.

The mode parameter has three parts: `group`, `access`, and `access type`. `group` accepts the following characters:

`u`

User

g
Group

o
Others

For `access`, grant access with `+` and deny it with `-`.

The `access` type is controlled by the following options:

r
Read

w
Write

x
Execute—executing files or changing to the directory

s
Setuid bit—the application or program is started as if it were started by the owner of the file

As an alternative, a numeric code can be used. The four digits of this code are composed of the sum of the values 4, 2, and 1—the decimal result of a binary mask. The first digit sets the set user ID (SUID) (4), the set group ID (2), and the sticky (1) bits. The second digit defines the permissions of the owner of the file. The third digit defines the permissions of the group members and the last digit sets the permissions for all other users. The read permission is set with 4, the write permission with 2, and the permission for executing a file is set with 1. The owner of a file would usually receive a 6 or a 7 for executable files.

`gzip[parameters]files`

This program compresses the contents of files using complex mathematical algorithms. Files compressed in this way are given the extension `.gz` and need to be uncompressed before they can be used. To compress several files or even entire directories, use the `tar` command.

-d
Decompresses the packed `gzip` files so they return to their original size and can be processed normally (like the command `gunzip`)

`tar options archive files`

`tar` puts one or more files into an archive. Compression is optional. `tar` is a quite complex command with a number of options available. The most frequently used options are:

- `-f`
Writes the output to a file and not to the screen as is usually the case
- `-c`
Creates a new tar archive
- `-r`
Adds files to an existing archive
- `-t`
Outputs the contents of an archive
- `-u`
Adds files, but only if they are newer than the files already contained in the archive
- `-x`
Unpacks files from an archive (*extraction*)
- `-z`
Packs the resulting archive with `gzip`
- `-j`
Compresses the resulting archive with `bzip2`
- `-v`
Lists files processed

The archive files created by `tar` end with `.tar`. If the tar archive was also compressed using `gzip`, the ending is `.tgz` or `.tar.gz`. If it was compressed using `bzip2`, the ending is `.tar.bz2`.

`locate patterns`

This command is only available if you have installed the `findutils-locate` package. The `locate` command can find in which directory a specified file is lo-

cated. If desired, use wild cards to specify filenames. The program is very speedy, because it uses a database specifically created for the purpose (rather than searching through the entire file system). This very fact, however, also results in a major drawback: `locate` is unable to find any files created after the latest update of its database. The database can be generated by `root` with `updatedb`.

`updatedb[options]`

This command performs an update of the database used by `locate`. To include files in all existing directories, run the program as `root`. It also makes sense to place it in the background by appending an ampersand (`&`), so you can immediately continue working on the same command line (`updatedb &`). This command usually runs as a daily cron job (see `cron.daily`).

`find[options]`

With `find`, search for a file in a given directory. The first argument specifies the directory in which to start the search. The option `-name` must be followed by a search string, which may also include wild cards. Unlike `locate`, which uses a database, `find` scans the actual directory.

Commands to Access File Contents

`file[options] [files]`

With `file`, detect the contents of the specified files.

`-z`

Tries to look inside compressed files

`cat [options] files`

The `cat` command displays the contents of a file, printing the entire contents to the screen without interruption.

`-n`

Numbers the output on the left margin

`less [options] files`

This command can be used to browse the contents of the specified file. Scroll half a screen page up or down with `PgUp` and `PgDn` or a full screen page down with `Space`. Jump to the beginning or end of a file using `Home` and `End`. Press `Q` to exit the program.

`grep[options]searchstringfiles`

The `grep` command finds a specific search string in the specified files. If the search string is found, the command displays the line in which `searchstring` was found along with the filename.

`-i`

Ignores case

`-H`

Only displays the names of the respective files, but not the text lines

`-n`

Additionally displays the numbers of the lines in which it found a hit

`-l`

Only lists the files in which `searchstring` does not occur

`diff[options]file1file2`

The `diff` command compares the contents of any two files. The output produced by the program lists all lines that do not match. This is frequently used by programmers who need only send their program alterations and not the entire source code.

`-q`

Only reports whether the two files differ

`-u`

Produces a “unified” diff, which makes the output more readable

File Systems

`mount[options][device]mountpoint`

This command can be used to mount any data media, such as hard disks, CD-ROM drives, and other drives, to a directory of the Linux file system.

`-r`

Mount read-only

`-t filesystem`

Specify the file system, commonly `ext2` for Linux hard disks, `msdos` for MS-DOS media, `vfat` for the Windows file system, and `iso9660` for CDs

For hard disks not defined in the file `/etc/fstab`, the device type must also be specified. In this case, only `root` can mount it. If the file system should also be mounted by other users, enter the option `user` in the appropriate line in the `/etc/fstab` file (separated by commas) and save this change. Further information is available in the `mount(1)` man page.

`umount [options] mountpoint`

This command unmounts a mounted drive from the file system. To prevent data loss, run this command before taking a removable data medium from its drive.

Normally, only `root` is allowed to run the commands `mount` and `umount`. To enable other users to run these commands, edit the `/etc/fstab` file to specify the option `user` for the respective drive.

8.12.2 System Commands

The following section lists a few of the most important commands needed for retrieving system information and controlling processes and the network.

System Information

`df [options] [directory]`

The `df` (disk free) command, when used without any options, displays information about the total disk space, the disk space currently in use, and the free space on all the mounted drives. If a directory is specified, the information is limited to the drive on which that directory is located.

`-h`

Shows the number of occupied blocks in gigabytes, megabytes, or kilobytes—in human-readable format

`-T`

Type of file system (`ext2`, `nfs`, etc.)

`du[options] [path]`

This command, when executed without any parameters, shows the total disk space occupied by files and subdirectories in the current directory.

- a
Displays the size of each individual file
- h
Output in human-readable form
- s
Displays only the calculated total size

`free[options]`

The command `free` displays information about RAM and swap space usage, showing the total and the used amount in both categories. See Section “The free Command” (Chapter 16, *Special System Features*, ↑Reference) for more information.

- b
Output in bytes
- k
Output in kilobytes
- m
Output in megabytes

`date[options]`

This simple program displays the current system time. If run as `root`, it can also be used to change the system time. Details about the program are available in the `date(1)` man page.

Processes

`top[options]`

`top` provides a quick overview of the currently running processes. Press `H` to access a page that briefly explains the main options for customizing the program.

`ps[options][process ID]`

If run without any options, this command displays a table of all your own programs or processes—those you started. The options for this command are not preceded by hyphen.

`aux`

Displays a detailed list of all processes, independent of the owner

`kill[options]process ID`

Unfortunately, sometimes a program cannot be terminated in the normal way. In most cases, you should still be able to stop such a runaway program by executing the `kill` command, specifying the respective process ID (see `top` and `ps`). `kill` sends a *TERM* signal that instructs the program to shut itself down. If this does not help, the following parameter can be used:

`-9`

Sends a *KILL* signal instead of a *TERM* signal, bringing the specified process to an end in almost all cases

`killall[options]processname`

This command is similar to `kill`, but uses the process name (instead of the process ID) as an argument, killing all processes with that name.

Network

`ping[options]hostname or IP address`

The `ping` command is the standard tool for testing the basic functionality of TCP/IP networks. It sends a small data packet to the destination host, requesting an immediate reply. If this works, `ping` displays a message to that effect, which indicates that the network link is basically functioning.

`-cnumber`

Determines the total number of packages to send and ends after they have been dispatched (by default, there is no limitation set)

`-f`

flood ping: sends as many data packages as possible; a popular means, reserved for `root`, to test networks

`-i`*value*

Specifies the interval between two data packages in seconds (default: one second)

`host` [*options*] `hostname` [*server*]

The domain name system resolves domain names to IP addresses. With this tool, send queries to name servers (DNS servers).

`ssh` [*options*] [*user*@]`hostname` [*command*]

SSH is actually an Internet protocol that enables you to work on remote hosts across a network. SSH is also the name of a Linux program that uses this protocol to enable operations on remote computers.

Miscellaneous

`passwd` [*options*] [*username*]

Users may change their own passwords at any time using this command. The administrator `root` can use the command to change the password of any user on the system.

`su` [*options*] [*username*]

The `su` command makes it possible to log in under a different username from a running session. Specify a username and the corresponding password. The password is not required from `root`, because `root` is authorized to assume the identity of any user. When using the command without specifying a username, you are prompted for the `root` password and change to the superuser (`root`). Use `su -` to start a login shell for a different user.

`halt` [*options*]

To avoid loss of data, you should always use this program to shut down your system.

`reboot` [*options*]

Does the same as `halt` except the system performs an immediate reboot.

`clear`

This command cleans up the visible area of the console. It has no options.

8.12.3 For More Information

There are many more commands than listed in this chapter. For information about other commands or more detailed information, the O'Reilly publication *Linux in a Nutshell* is recommended.

Part II. Mobility

Mobile Computing with Linux

Mobile computing is mostly associated with laptops, PDAs, and cellular phones and the data exchange between them. Mobile hardware components, such as external hard disks, flash drives, or digital cameras, can be connected to laptops or desktop systems. A number of software components are involved in mobile computing scenarios and some applications are tailor-made for mobile use.

9.1 Laptops

The hardware of laptops differs from that of a normal desktop system. This is because criteria like exchangeability, occupied space, and power consumption are relevant properties. The manufacturers of mobile hardware have developed standard interfaces like PCMCIA (Personal Computer Memory Card International Association), Mini PCI, and Mini PCIe that can be used to extend the hardware of laptops. The standards cover memory cards, network interface cards, ISDN and modem cards, and external hard disks.

TIP: openSUSE and Tablet PCs

openSUSE also supports Tablet PCs. Tablet PCs come with a touchpad/digitizer that allows you to use a digital pen or even fingertips to edit data right on the screen instead of using mouse and keyboard. They are installed and configured much like any other system. For a detailed introduction to the installation and configuration of Tablet PCs, refer to Chapter 31, *Using Tablet PCs* (↑Reference).

9.1.1 Power Conservation

The inclusion of energy-optimized system components when manufacturing laptops contributes to their suitability for use without access to the electrical power grid. Their contribution towards conservation of power is at least as important as that of the operating system. openSUSE® supports various methods that influence the power consumption of a laptop and have varying effects on the operating time under battery power. The following list is in descending order of contribution towards power conservation:

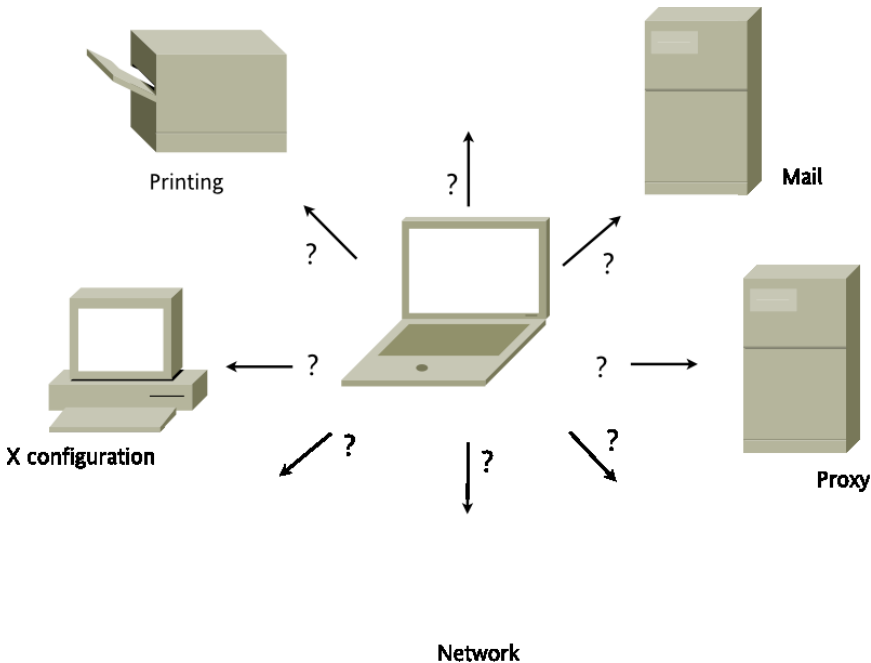

- Throttling the CPU speed.
- Switching off the display illumination during pauses.
- Manually adjusting the display illumination.
- Disconnecting unused, hotplug-enabled accessories (USB CD-ROM, external mouse, unused PCMCIA cards, WLAN, etc.).
- Spinning down the hard disk when idling.

For more information on how to use the KDE power management applet, refer to Chapter 8, *Controlling Your Desktop's Power Management with KPowerSave* (↑KDE User Guide).

9.1.2 Integration in Changing Operating Environments

Your system needs to adapt to changing operating environments when used for mobile computing. A lot of services depend on the environment and the underlying clients must be reconfigured. openSUSE handles this task for you.

Figure 9.1 *Integrating a Mobile Computer in an Existing Environment*

The services affected in the case of a laptop commuting back and forth between a small home network and an office network are:

Network

This includes IP address assignment, name resolution, Internet connectivity, and connectivity to other networks.

Printing

A current database of available printers and an available print server must be present, depending on the network.

E-Mail and Proxies

As with printing, the list of the corresponding servers must be current.

X (Graphical Environment)

If your laptop is temporarily connected to a beamer or an external monitor, the different display configurations must be available.

openSUSE offers several ways of integrating a laptop into existing operating environments:

NetworkManager

NetworkManager is especially tailored for mobile networking on laptops. It provides a means to easily and automatically switch between network environments or different types of networks, such as wireless LAN and ethernet. NetworkManager supports WEP and WPA-PSK encryption in wireless LANs. It also supports dial-up connections (with smpppd). Both desktop environments (GNOME and KDE) include a front-end to NetworkManager. For more information about the desktop applets, see [Section 10.4, “Using KDE NetworkManager Widget”](#) (page 156) and [Section 10.5, “Using GNOME NetworkManager Applet”](#) (page 157).

Table 9.1 *Use Cases for NetworkManager*

My computer...	Use NetworkManager
is a laptop	Yes
is sometimes attached to different networks	Yes
provides network services (such as DNS or DHCP)	No
only uses a static IP address	No

Use the YaST tools to configure networking whenever NetworkManager should not handle network configuration.

SCPM

SCPM (system configuration profile management) allows storage of arbitrary configuration states of a system into a kind of “snapshot” called a *profile*. Profiles can be created for different situations. They are useful when a system is operated in changing environments (home network, office network). It is always possible to switch between profiles. To get SCPM up and running on your system, install the package `kscpm`, add the Profile Chooser KDE applet to your panel, enable SCPM using the YaST Profile Management module, and configure the users that should be allowed to switch profiles without the need of entering the `root` password. Determine whether profile changes should survive a system reboot or whether they should be discarded upon shutdown. Make sure all resource groups (i.e. services like network and printer, for example) are active. Proceed to creating actual profiles using the SUMF (SCPM Unified Management Front-End) tool which is started via Profile Chooser. Create profiles for all the different setups you want to use this system in. Switching between profiles can either be done in the running system via the Profile Chooser applet or at system boot time via the `F3` key. When switching profiles, SCPM automatically adjusts your system configuration to the new environment laid out in the profile you have chosen.

SLP

The service location protocol (SLP) simplifies the connection of a laptop to an existing network. Without SLP, the administrator of a laptop usually requires detailed knowledge of the services available in a network. SLP broadcasts the availability of a certain type of service to all clients in a local network. Applications that support SLP can process the information dispatched by SLP and be configured automatically. SLP can even be used for the installation of a system, sparing the effort of searching for a suitable installation source. Find detailed information about SLP in Chapter 21, *SLP Services in the Network* (↑Reference).

9.1.3 Software Options

There are various special task areas in mobile use that are covered by dedicated software: system monitoring (especially the battery charge), data synchronization, and wireless communication with peripherals and the Internet. The following sections cover the most important applications that openSUSE provides for each task.

System Monitoring

Two KDE system monitoring tools are provided by openSUSE:

KPowersave

KPowersave is an applet that displays the state of the rechargeable battery in the control panel. The icon adjusts to represent the type of power supply. When working on AC power, a small plug icon is displayed. When working on batteries, the icon changes to a battery. The corresponding menu opens the YaST module for power management after requesting the `root` password. This allows setting the behavior of the system for different power sources.

KSysguard

KSysguard is an independent application that gathers all measurable parameters of the system into one monitoring environment. KSysguard has monitors for ACPI (battery status), CPU load, network, partitioning, and memory usage. It can also watch and display all system processes. The presentation and filtering of the collected data can be customized. It is possible to monitor different system parameters in various data pages or collect the data of various machines in parallel over the network. KSysguard can also run as a daemon on machines without a KDE environment. Find more information about this program in its integrated help function or in the SUSE help pages.

In the GNOME desktop, use GNOME Power Manager and System Monitor.

Synchronizing Data

When switching between working on a mobile machine disconnected from the network and working at a networked workstation in an office, it is necessary to keep processed data synchronized across all instances. This could include e-mail folders, directories,

and individual files that need to be present for work on the road as well as at the office. The solution in both cases is as follows:

Synchronizing E-Mail

Use an IMAP account for storing your e-mails in the office network. Then access the e-mails from the workstation using any disconnected IMAP-enabled e-mail client, like Mozilla Thunderbird Mail, Evolution, or KMail as described in GNOME User Guide (↑GNOME User Guide) and KDE User Guide (↑KDE User Guide). The e-mail client must be configured so that the same folder is always accessed for `Sent` messages. This ensures that all messages are available along with their status information after the synchronization process has completed. Use an SMTP server implemented in the mail client for sending messages instead of the systemwide MTA postfix or sendmail to receive reliable feedback about unsent mail.

Synchronizing Files and Directories

There are several utilities suitable for synchronizing data between a laptop and a workstation. For detailed information, refer to [Chapter 11, *Copying and Sharing Files*](#) (page 163).

Wireless Communication

As well as connecting to a home or office network with a cable, a laptop can also wirelessly connect to other computers, peripherals, cellular phones, or PDAs. Linux supports three types of wireless communication:

WLAN

With the largest range of these wireless technologies, WLAN is the only one suitable for the operation of large and sometimes even spatially disjointed networks. Single machines can connect with each other to form an independent wireless network or access the Internet. Devices called *access points* act as base stations for WLAN-enabled devices and act as intermediaries for access to the Internet. A mobile user can switch among access points depending on location and which access point is offering the best connection. Like in cellular telephony, a large network is available to WLAN users without binding them to a specific location for accessing it. Find details about WLAN in Section “Wireless LAN” (Chapter 30, *Wireless Communication*, ↑Reference).

Bluetooth

Bluetooth has the broadest application spectrum of all wireless technologies. It can be used for communication between computers (laptops) and PDAs or cellular phones, as can IrDA. It can also be used to connect various computers within visible range. Bluetooth is also used to connect wireless system components, like a keyboard or mouse. The range of this technology is, however, not sufficient to connect remote systems to a network. WLAN is the technology of choice for communicating through physical obstacles like walls.

IrDA

IrDA is the wireless technology with the shortest range. Both communication parties must be within viewing distance of each other. Obstacles like walls cannot be overcome. One possible application of IrDA is the transmission of a file from a laptop to a cellular phone. The short path from the laptop to the cellular phone is then covered using IrDA. The long range transport of the file to the recipient of the file is handled by the mobile network. Another application of IrDA is the wireless transmission of printing jobs in the office.

9.1.4 Data Security

Ideally, you protect data on your laptop against unauthorized access in multiple ways. Possible security measures can be taken in the following areas:

Protection against Theft

Always physically secure your system against theft whenever possible. Various securing tools, like chains, are available in retail stores.

Strong Authentication

Use biometric authentication in addition to standard authentication via login and password. openSUSE supports fingerprint authentication. For more details, see Chapter 32, *Using the Fingerprint Reader* (↑Reference).

Securing Data on the System

Important data should not only be encrypted during transmission, but also on the hard disk. This ensures its safety in case of theft. The creation of an encrypted partition with openSUSE is described in Chapter 36, *Encrypting Partitions and Files* (↑Reference). Another possibility is to create encrypted home directories when adding the user with YaST.

IMPORTANT: Data Security and Suspend to Disk

Encrypted partitions are not unmounted during a suspend to disk event. Thus, all data on these partitions is available to any party who manages to steal the hardware and issue a resume of the hard disk.

Network Security

Any transfer of data should be secured, no matter how it takes place. Find general security issues regarding Linux and networks in Chapter 38, *Security and Confidentiality* (↑Reference). Security measures related to wireless networking are provided in Chapter 30, *Wireless Communication* (↑Reference).

9.2 Mobile Hardware

openSUSE supports the automatic detection of mobile storage devices over FireWire (IEEE 1394) or USB. The term *mobile storage device* applies to any kind of FireWire or USB hard disk, USB flash drive, or digital camera. These devices are automatically detected and configured as soon as they are connected with the system over the corresponding interface. The file managers of both GNOME and KDE offer flexible handling of mobile hardware items. To unmount any of these media safely, use the *Safely Remove* (KDE) or *Unmount Volume* (GNOME) feature of either file manager. The handling of removable media by your desktop is described in more detail in GNOME User Guide (↑GNOME User Guide) and KDE User Guide (↑KDE User Guide).

External Hard Disks (USB and FireWire)

As soon as an external hard disk has been correctly recognized by the system, its icon appears in the file manager. Clicking the icon displays the contents of the drive. It is possible to create folders and files here and edit or delete them. To rename a hard disk from the name it had been given by the system, select the corresponding menu item from the menu that opens when the icon is right-clicked. This name change is limited to display in the file manager. The descriptor by which the device is mounted in `/media` remains unaffected by this.

USB Flash Drives

These devices are handled by the system just like external hard disks. It is similarly possible to rename the entries in the file manager.

Digital Cameras (USB and FireWire)

Digital cameras recognized by the system also appear as external drives in the overview of the file manager. KDE allows reading and accessing the pictures at the URL `camera: /`. The images can then be processed using digiKam or f-spot. For advanced photo processing use The GIMP. For a short introduction to digiKam, f-spot and The GIMP, see Chapter 23, *Managing Your Digital Image Collection* (↑Application Guide), Chapter 24, *Managing Your Digital Image Collection with F-Spot* (↑Application Guide) and Chapter 22, *Manipulating Graphics with The GIMP* (↑Application Guide).

9.3 Cellular Phones and PDAs

A desktop system or a laptop can communicate with a cellular phone via Bluetooth or IrDA. Some models support both protocols and some only one of the two. The usage areas for the two protocols and the corresponding extended documentation has already been mentioned in **Section “Wireless Communication”** (page 147). The configuration of these protocols on the cellular phones themselves is described in their manuals.

The support for synchronizing with handheld devices manufactured by Palm, Inc., is already built into Evolution and Kontact. Initial connection with the device is, in both cases, easily performed with the assistance of a wizard. Once the support for Palm Pilots is configured, it is necessary to determine which type of data should be synchronized (addresses, appointments, etc.). For more information, see GNOME User Guide (↑GNOME User Guide) and KDE User Guide (↑KDE User Guide).

A more sophisticated synchronization solution is available with the program `opensync` (see packages `libopensync`, `msyncntool` and the respective plug-ins for the different devices).

9.4 For More Information

The central point of reference for all questions regarding mobile devices and Linux is <http://tuxmobil.org/>. Various sections of that Web site deal with the hardware and software aspects of laptops, PDAs, cellular phones, and other mobile hardware.

A similar approach to that of <http://tuxmobil.org/> is made by <http://www.linux-on-laptops.com/>. Information about laptops and handhelds can be found here.

SUSE maintains a mailing list in German dedicated to the subject of laptops. See <http://lists.opensuse.org/opensuse-mobile-de/>. On this list, users and developers discuss all aspects of mobile computing with openSUSE. Postings in English are answered, but the majority of the archived information is only available in German. Use <http://lists.opensuse.org/opensuse-mobile/> for English postings.

Information about OpenSync is available on <http://en.opensuse.org/OpenSync>.

Using NetworkManager

NetworkManager is the ideal solution for laptops and other portable computers. With NetworkManager, you do not need to worry about configuring network interfaces and switching between wired or wireless networks when you are moving. NetworkManager can automatically connect to known wireless networks. It can also manage several network connections in parallel, the fastest connection is then used as default. Furthermore, you can switch between available networks manually and manage your network connection using an applet or widget in the system tray.

On laptop computers, NetworkManager is active by default. However it can be at any time activated or deactivated using YaST as described in [Section 10.2, “Enabling NetworkManager”](#) (page 154).

10.1 Use Cases for NetworkManager

NetworkManager provides a sophisticated and intuitive user interface which enables users easily to switch their network environment. However, NetworkManager is not a suitable solution in the following cases:

- Your computer provides network services for other computers in your network, for example, it is a DHCP or DNS server.
- Your computer is a Xen server or your system is a virtual system inside Xen.

- You want to use SCPM for network configuration management. To use SCPM and NetworkManager at the same time, disable the network resource in SCPM configuration.

10.2 Enabling NetworkManager

If you want to manage your network connection with NetworkManager, enable NetworkManager in the YaST Network Settings module. To enable NetworkManager, proceed as follows:

- 1 Run YaST and go to *Network Devices > Network Settings*.
- 2 The *Network Settings* dialog opens. Go to the *Global Options* tab.
- 3 In the *Network Setup Method* field, activate *User Controlled with NetworkManager*.
- 4 Click *Finish*.
- 5 After choosing the method for managing network connections, set up your network card using automatic configuration via DHCP or a static IP address or configure your modem (for dial-up connections, use *Network Devices > Modem*). To configure an internal or USB ISDN modem, select *Network Devices > ISDN*. To configure an internal or USB DSL modem, select *Network Devices > DSL*.

Find a detailed description of the network configuration with YaST in Section “Configuring a Network Connection with YaST” (Chapter 20, *Basic Networking*, ↑Reference) and Section “Wireless LAN” (Chapter 30, *Wireless Communication*, ↑Reference).

After having enabled NetworkManager, configure your network connections with the NetworkManager as described in [Section 10.3, “Configuring Network Connections”](#) (page 155).

If you want to deactivate NetworkManager and control network the traditional way, choose the *Traditional Method with ifup* option in the *Network Setup Method* field.

10.3 Configuring Network Connections

After having enabled NetworkManager in YaST, configure your network connections in a dialog available from the GNOME Control Center or from the Personal Settings in KDE 4. If you use GNOME, start the GNOME Control Center from the main menu, then select *System > Network Configurations* to open the *Network Configuration* dialog. If you use KDE, start the *Personal Settings* from the main menu by clicking *Configure Desktop*, then select *Advanced > Network Settings* to open the *Network Settings* dialog.

Figure 10.1 GNOME Network Configuration Dialog

Alternatively, you can start the configuration dialogs from the NetworkManager applet/widget in the system tray by clicking *Configure* (KDE) or by right-clicking the GNOME applet and selecting *Edit Connections*.

The GNOME and KDE 4 configuration dialog shows tabs for all types of network connections, such as wired, wireless, Mobile Broadband, DSL, and VPN connections. NetworkManager also supports connections to 802.1X protected networks.

To add a new connection, click the tab for the connection type you want to use and click *Add*. Enter a *Connection Name* and your connection details and click *OK* or *Apply*. The newly configured network connection now appears in the list of available networks you get by left-clicking the NetworkManager applet or widget.

NOTE: Hidden Networks

To connect to a “hidden” network (a network that does not broadcast its service) you have to know the Extended Service Set Identifier (ESSID) of the network because it cannot be detected automatically. In this case, enter the ESSID and the encryption parameters, if necessary.

When editing each connection, you can also define if NetworkManager should automatically use this connection (activate *Connect Automatically*) or should use this connection systemwide (activate *System Connection*). *System Connections* can be shared by all users and are made available during boot time—before any users log in.

10.4 Using KDE NetworkManager Widget

In KDE 4, the KNetworkManager applet for controlling NetworkManager has been replaced by the NetworkManager widget. Widgets are small applications that can be integrated into your desktop or your panel. If the network has been set up for NetworkManager control, the widget usually starts automatically with the desktop environment and is shown as icon in the system tray.

The NetworkManager widget shows the current network status as an icon and reports on changes using notifications. Use the widget to configure new network connections, to manually select another network connection, to disable the use of wireless networks, or to switch to offline mode altogether, if needed. The appearance of the icon depends on the type and state of the current network connection. Hold the mouse cursor over the icon to see details about the connection.

NetworkManager distinguishes two types of connections: trusted and untrusted. A trusted connection is any network that you explicitly selected. All others are untrusted. Right-click the connection icons to show a list of connections that you have already used at least once in the past. The currently used connection is marked in the menu.

Left-click any of the connection applets to choose another network connection at any time. Such a choice takes priority over automatically selected networks. The chosen network is used as long as it is available, meaning that plugging a network cable in does not switch to a wired network connection automatically.

10.5 Using GNOME NetworkManager Applet

In GNOME, NetworkManager can be controlled with the GNOME NetworkManager applet. If the network is set up for NetworkManager control, the applet usually starts automatically with the desktop environment and is shown as an icon in the system tray.

If your system tray does not show GNOME NetworkManager applet, the applet is probably not started. Press Alt + F2 and enter `nm-applet` to start it manually.

10.5.1 Connecting to Wired Networks

If your computer is connected to an existing network with a network cable, use the NetworkManager applet to choose the network connection.

- 1 Left-click the applet icon to show a menu with available networks. The currently used connection is selected in the menu.
- 2 To switch to another network, choose it from the list.
- 3 To switch off all network connections, both wired and wireless, right-click the applet icon and uncheck *Enable Networking*.

10.5.2 Connecting to Wireless Networks

Available visible wireless networks are listed in the GNOME NetworkManager applet menu under *Wireless Networks*. The signal strength of each network is also shown in the menu. Encrypted wireless networks are marked with a shield icon.

Procedure 10.1 *Connecting to a Wireless Network*

- 1 To connect to a wireless network, left-click the applet icon and choose an entry from the list of available wireless networks.
- 2 If the network is encrypted, a dialog opens. Choose the type of *Wireless Security* the network uses and enter the appropriate *Password*.

- 3 To connect to a network that does not broadcast its service set identifier (ESSID) and therefore cannot be detected automatically, left-click the NetworkManager icon and choose *Connect to Other Wireless Network*.
- 4 In the dialog that opens, enter the ESSID and set encryption parameters if necessary.
- 5 To disable wireless networking, right-click the applet icon and uncheck *Enable Wireless*. This can be very useful if you are on a plane or in any other environment where wireless networking is not allowed.

10.5.3 Configuring Your Wireless Card as an Access Point

If your wireless card supports access point mode, you can use NetworkManager for configuration.

- 1 Click *Create New Wireless Network*.

New wireless network

Enter a name for the wireless network you wish to create.

Network Name: TUXnet

Wireless Security: WPA & WPA2 Personal

Password:

Show password

Cancel Connect

- 2 Add the network name and set the encryption in the *Wireless Security* dialog.

IMPORTANT: Unprotected Wireless Networks Are a Security Risk

If you set *Wireless Security* to `None`, everybody can connect to your network, reuse your connectivity and intercept your network connection. To restrict access to your access point and to secure your connection,

use encryption. You can choose between various WEP and WPA-based encryptions. If you are not sure which technology is best for you, read Section “Authentication” (Chapter 30, *Wireless Communication*, ↑Reference).

10.5.4 GNOME Keyring Manager

If you do not want to enter your credentials anew each time you want to connect to an encrypted network, you can use GNOME Keyring Manager to store your credentials encrypted on the disk, secured by a master password. Whenever any GNOME application that uses GNOME Keyring needs to access passwords or credentials stored there, a check is made if the keyring is locked or not. If it is locked, you will be prompted for the master password to unlock the keyring. For more information about GNOME Keyring Manager, refer to Section “Managing Keyrings” (Chapter 2, *Customizing Your Settings*, ↑GNOME User Guide).

10.6 NetworkManager and Security

NetworkManager distinguishes two types of wireless connections, trusted and untrusted. A trusted connection is any network that you explicitly selected in the past. All others are untrusted. Trusted connections are identified by the name and MAC address of the access point. Using the MAC address ensures that you cannot use a different access point with the name of your trusted connection.

NetworkManager periodically scans for available wireless networks. If multiple trusted networks are found, the most recently used is automatically selected. NetworkManager waits for your selection in case that all networks are untrusted.

If the encryption setting changes but the name and MAC address remain the same, NetworkManager attempts to connect, but first you are asked to confirm the new encryption settings and provide any updates, such as a new key.

NetworkManager knows two types of connections: `user` and `system` connections. If a connection is defined as *System connection*, it can be shared by all users and is made available during boot time—before any users log in. Such system connections can be used to automatically connect to networks that require authorization.

If you switch to offline mode from using a wireless connection, NetworkManager blanks the ESSID. This ensures that the card is disconnected.

10.7 NetworkManager and VPN

NetworkManager supports several Virtual Private Network (VPN) technologies:

- NovellVPN—package `NetworkManager-novellvpn`
- OpenVPN—package `NetworkManager-openvpn`
- vpnc (Cisco)—package `NetworkManager-vpnc`
- PPTP (Point-to-Point Tunneling Protocol)—package `NetworkManager-pptp`

To use VPN with NetworkManager, install the appropriate VPN packages first. You need two packages for each VPN technology: one of the packages above (providing the generic support for NetworkManager), and the respective desktop-specific package for your applet.

For KDE, choose one of the following:

- NovellVPN support for KNetworkManager—package `NetworkManager-novellvpn-kde4`
- OpenVPN support for KNetworkManager—package `NetworkManager-openvpn-kde4`
- vpnc (Cisco) support for KNetworkManager—package `NetworkManager-vpnc-kde4`

PPTP support for KDE is not available yet, but is being worked on.

For GNOME, choose one of the following:

- NovellVPN support for GNOME NetworkManager applet—package `NetworkManager-novellvpn-gnome`

- OpenVPN support for GNOME NetworkManager applet—package `NetworkManager-openvpn-gnome`
- vpnc (Cisco) support for GNOME NetworkManager applet—package `NetworkManager-vpnc-gnome`
- PPTP (Point-to-Point Tunneling Protocol) support for GNOME NetworkManager applet—package `NetworkManager-pptp-gnome`

After you have installed the packages, configure your VPN connection as described in [Section 10.3, “Configuring Network Connections”](#) (page 155).

10.8 Troubleshooting

Connection problems can occur. Some common problems related to NetworkManager include the applet not starting, a missing VPN option, and issues with SCPM. Methods for resolving and preventing these problems depend on the tool used.

NetworkManager Desktop Applet/Widget Does Not Start

GNOME NetworkManager applet or KDE NetworkManager widget should start automatically if the network is set up for NetworkManager control. If the applet/widget does not start, check if NetworkManager is enabled in YaST as described in [Section 10.2, “Enabling NetworkManager”](#) (page 154). Then make sure that the appropriate package for your desktop environment is also installed. If you are using KDE 4, the package is `NetworkManager-kde4`. For GNOME users the package is `NetworkManager-gnome`.

If the GNOME desktop applet is installed but is not running for some reason (perhaps you quit it accidentally), start it manually with the command `nm-applet`.

If your KDE 4 system tray does not show any icon for network connections (as might be the case after switching from a static network configuration to user-controlled with NetworkManager in YaST), add the NetworkManager widget to the panel: right-click an empty patch on the panel, and select *Panel Options > Add Widgets*. (If your desktop objects are currently locked, you might need to click *Unlock Widgets* first before you can add any objects.) In the dialog box that appears, select *NetworkManager* and click *Add Widget*.

NetworkManager Applet/Widget Does Not Include the VPN Option

Support for NetworkManager, applets, and VPN for NetworkManager is distributed in separate packages. If your NetworkManager applet/widget does not include the VPN option, check if the packages with NetworkManager support for your VPN technology are installed. For more information, see [Section 10.7, “NetworkManager and VPN”](#) (page 160).

SCPM Does Not Switch the Network Configuration

You are probably using SCPM together with NetworkManager. NetworkManager is not currently able to work with SCPM profiles. Do not use NetworkManager together with SCPM when SCPM profiles also change network settings. To use SCPM and NetworkManager at the same time, disable the network resource in SCPM configuration.

No Network Connection Available

If you have configured your network connection correctly and all other components for the network connection (router, etc.) are also up and running, it sometimes helps to restart the network interfaces on your computer. To do so, log in to a command line as `root` and run `rcnetwork restart`.

10.9 For More Information

More information about NetworkManager can be found on the following Web sites and directories:

- <http://www.gnome.org/projects/NetworkManager/>—NetworkManager project page
- For more information on KDE NetworkManager widget refer to <http://userbase.kde.org/KNetworkManager>.
- Also check out the information in the following directories for the latest information about NetworkManager and the GNOME NetworkManager applet and the KDE NetworkManager widget: `/usr/share/doc/packages/NetworkManager/`, `/usr/share/doc/packages/NetworkManager-kde4/` and `/usr/share/doc/packages/NetworkManager-gnome/`

Copying and Sharing Files

If using multiple operating systems (OS) simultaneously, it is often necessary to exchange files among them. Different systems may reside on different partitions on the same machine or on different machines across your network. There are various approaches to file exchange with different basic instructions and possible pitfalls.

WARNING: Scenarios for Private Home Networks Only

Do not use the following scenarios in networks other than your own private and trusted home network that is protected by a firewall. Implementing high security measures for the configurations featured in the following sections is beyond the scope of this document.

Exchanging data may encompass either one of the following tasks:

Copying

To copy your data means to transfer your data from one system to the other. This results in identical objects on both the source and the target system.

Synchronizing data is a special way to copy data. If you change a file on one computer, it is automatically changed on the other computer after the synchronization. For example, think of a laptop that contains your modified files and you want to have the same contents on your desktop computer.

Sharing

Sharing your files means establishing a client/server relationship. The server provides files that can be accessed by the client. When changing a file, you modify it

on the server, not locally on the client. File servers typically serve a large number of clients simultaneously.

11.1 Scenarios

The following list provides a number of possible scenarios involving file transfer:

Different OS on the Same Computer

Many users have an operating system preinstalled by their vendor and run Linux in a separate partition. Refer to [Section 11.3, “Accessing Files on Different OS on the Same Computer”](#) (page 166) for more information.

Different Computers Not Connected by a Network

Save the data to any media (CD, DVD, USB flash drive, or external hard disk) and connect these to the target machine to copy your files. This solution is inexpensive, intuitive, and straightforward. However, you need the appropriate drives or ports on both computers. Media are suited to occasional file transfers with limited file size. If you need a more permanent solution, consider connecting them with a network.

Different Computers Connected to the Same Network

Set up a server of any kind on one computer, connect the server and the client, and transfer the files from server to client. Choose from various protocols available and pick the one that best matches your needs and expertise.

The client/server setup requires more expertise and maintenance efforts, but is better suited to routine transfer needs and exchange with multiple systems. If you are looking for a permanent file exchange, choose a client/server-based method. This method does not impose any limits on the amount of data that can be transferred. See [Section 11.2, “Access Methods”](#) (page 165).

Different Computers on Different Networks

This scenario requires connection of different networks and is beyond the scope of this document. Transfer files as if the computers were not connected to a network.

11.2 Access Methods

The following methods and protocols are well-suited to file transfer and sharing.

FTP

Use FTP (File Transfer Protocol) if you need to exchange files very often and with different users. Set up an FTP server on one system and access it with clients. There are many graphical client applications available for FTP on Windows*, MacOS, and Linux. Depending on how your FTP server is used, enable read and write permissions. See [Section 11.4.4, “Copying Files with FTP”](#) (page 173) for more details on FTP.

NFS

NFS (Network File System) is a client/server system. A server exports one or more directories that can be imported by a client. For more information, see Chapter 27, *Sharing File Systems with NFS* (↑Reference).

Use NFS if you share files very often and for different users. Generally, this protocol is more common in the Linux world than in the Windows world. An NFS export integrates well into your Linux system and you can browse the imported directory structure like any other folder on your local machine. Depending on your configuration, enable either read or write permissions or both on the server. In general, for a home user it makes sense to allow read and write access.

rsync

Use rsync to transfer regularly large volumes of data that does not change considerably. It is available on Linux and Windows. A typical use case for rsync is managing data backups. Refer to the manual page of the `rsync` command and [Section 11.4.2, “Transferring Files with rsync”](#) (page 169) for more information.

Unison

Unison is an alternative to rsync. It is used to regularly synchronize files between different computers but has the advantage to behave bidirectionally. Refer to the manual page of the Unison command and [Section 11.4.3, “Transferring Files with Unison”](#) (page 171) for more information. Unison is available on Linux and Windows.

SMB

Samba is a client/server system and an implementation of the SMB protocol. It is usually used in Windows networks, but is supported by several operating systems.

Use Samba if you need to share files very often and with different users, especially to Windows systems. Samba as a Linux-only solution is uncommon, use NFS instead. For more information about setting up a Samba server, refer to [Section 11.7, “Sharing Files between Linux and Windows with Samba”](#) (page 180).

SSH

SSH (Secure Shell) enables a secure connection between computer. The SSH suite consists of several commands and uses public key encryption to authenticate users. For more information, see Chapter 34, *SSH: Secure Network Operations* (↑Reference).

Use SSH if you copy files occasionally over an untrusted network and if you are the only user doing so. Although there are graphical user interfaces available, SSH is mainly considered a command line utility and is available on Linux and Windows.

11.3 Accessing Files on Different OS on the Same Computer

New computers generally ship with a preinstalled operating system, usually Windows. If you have installed Linux on a different partition, you might want to exchange files between the different operating systems.

Windows can not read Linux partitions per default. If you want to exchange files between these two operating systems, you have to create an “exchange partition”. If you prefer a more directly approach look at <http://www.fs-driver.org/> to get a driver supporting an ext2 filesystem on Windows. The following file systems are used by Windows and can be accessed from a Linux machine:

FAT

Various flavors of this file system are used by MS-DOS and Windows 95 and 98. You can create this type of file system with YaST. It is possible to read and write files on FAT partitions from Linux. The size of a FAT partition and even the maximum size of a single file is subject to restrictions, depending on the FAT version. See <http://en.wikipedia.org/wiki/VFAT> for more information about FAT file systems.

NTFS

The NTFS file system is used by Windows NT, Windows 2000, Windows XP, Windows Server 2003 and Windows Vista. openSUSE includes write access support to the NTFS file system. However, the driver for the NTFS-3g filesystem has limited functionality. At the moment there is no support for Windows file permissions and you can not access encoded or compressed files. See <http://en.opensuse.org/NTFS-3g> for more information about NTFS-3g.

During the installation of openSUSE, your Windows partitions are detected. After starting your Linux system, the Windows partitions usually are mounted. These are possible ways of accessing your Windows data:

KDE

Press `Alt + F2` and enter `sysinfo:/`. A new window opens displaying the characteristics of your machine. *Disk Information* lists your partitions. Look at those that are of the file system type `ntfs` or `vfat` and click on these entries. If the partition is not already mounted, KDE mounts the partition now and displays the contents.

Command Line

Just list the contents of `/windows` to see one or more directories containing your Windows drives. The directory `/windows/c` maps to the Windows drive `C:\`, for example.

NOTE: Changing the Accessibility of Windows Partitions

Initially, Windows partitions are mounted read-only for normal users to avoid accidental damage to the file system. To grant normal users full access to a mounted Windows partition, change the mount behavior of this Windows partition. Refer to the manual page of the `mount` command for more information on mount options for `vfat` and to the manual page of `ntfs-3g` on mount options for NTFS.

11.4 Copying Files between Linux Computers

Linux offers a rich set of protocols you can use to copy files between computers. Which protocol you use depends on how much effort you want to invest and whether you need to be compatible with future Windows installations. The following sections feature various methods to transfer files from and to Linux computers. Make sure that you have a working network connection, because otherwise they will not work. All scenarios rely on working name resolution in the network. If your network does not include a name service, use IP addresses directly or add the IP addresses along with respective hostnames to `/etc/hosts` on all clients.

The following example IP addresses and hostnames are used across this section:

Target Hostname	jupiter.example.com
Target IP	192.168.2.100
Source Hostname	venus.example.com
Source IP	192.168.2.101
User	tux

11.4.1 Copying Files with SSH

The following requirements must be met on both computers that are accessed via SSH:

1. If you use a hostname, make sure each hostname is listed in `/etc/hosts` on both computers (see Section “`/etc/hosts`” (Chapter 20, *Basic Networking*, ↑Reference).) If you use SSH with IP addresses, you do not need to change anything.
2. If you use a firewall, open the SSH port. To do so, start YaST, and select *Security and Users > Firewall*. Go to *Allowed Services* and check whether *SSH* is displayed as part of the list. If this is not the case, select *SSH* from *Service to Allow* and click *Add*. Apply your changes and leave YaST with *Next* and *Finish*.

To copy files from one computer to another, you need to know where the files are located. For example, to copy a single file `/srv/foo_file` from computer `jupiter.example.com` to the current directory, use the following `scp` command (the dot represents the current directory as the copy target location):

```
scp tux@jupiter.example.com:/srv/foo_file .
```

To copy a whole directory structure, use the recursive mode of `scp`:

```
scp -r tux@jupiter.example.com:/srv/foo_directory .
```

If your network does not provide name resolution, use the server's IP address directly:

```
scp tux@192.168.2.100:/srv/foo_file .
```

If you do not know exactly where your files are, use the `sftp` command. Copying files in KDE or GNOME with SFTP is very simple. Proceed as follows:

- 1 Press `Alt + F2`.
- 2 Enter the following at the address prompt:

```
sftp://tux@jupiter.example.com
```
- 3 Enter the password of `tux` on `jupiter.example.com`.
- 4 Drag and drop the desired files or directories to your desktop or a local directory.

KDE provides another protocol called `fish` that can be used if `sftp` is not available. The use of this protocol is similar to `sftp`. Just replace the `sftp` protocol prefix of the URL with `fish`:

```
fish://tux@jupiter.example.com
```

11.4.2 Transferring Files with `rsync`

Before using `rsync` to synchronize files and directories between different computers, make sure that the following requirements are met:

1. The package `rsync` is installed.
2. Identical users are available on both systems.

3. Enough disk space is available on the server.
4. If you want to benefit from rsync's full potential, make sure that rsyncd is installed on the system to use as the server.

rsync is useful for archiving or copying data and can also be used as a daemon to provide directories to the network (see [Advanced Setup for rsync Synchronization](#) (page 170)).

rsync Basic Mode

The basic mode of operation of rsync does not require any special configuration. rsync mirrors complete directories onto another system. Its usage is not much different from a regular copying tool, such as scp. The following command creates a backup of the home directory of tux on a backup server called jupiter:

```
rsync -Hbaz -e ssh /home/tux/ tux@jupiter:backup
```

Use the following command to restore your backup:

```
rsync -Haz -e ssh tux@jupiter:backup /home/tux/
```

rsync Daemon Mode

Start the rsyncd daemon on one of your systems to make use of the full functionality of rsync. In this mode, it is possible to create synchronization points (modules) that can be accessed without an account. To use the rsyncd daemon, proceed as follows:

Procedure 11.1 *Advanced Setup for rsync Synchronization*

- 1 Log in as root and install the rsync package.
- 2 Configure your synchronization points in `/etc/rsyncd.conf`. Add a point with its name in brackets and add the `path` keyword like in the following example:

```
[FTP]
  path = /srv/ftp
  comment = An Example
```

3 Start the rsyncd daemon as root with `rcrsyncd start`. To start the rsync service automatically during each system boot, run `insserv rsyncd`.

4 List all files located in the `/srv/ftp` directory (note the double colon):

```
rsync -avz jupiter::FTP
```

5 Initiate the transfer by providing a target directory (in this example, the current directory is represented by a dot):

```
rsync -avz jupiter::FTP .
```

By default, files are not deleted while synchronizing with rsync. To force file deletion, add the `--delete` option. To make sure that `--delete` does not accidentally remove newer files, use the `--update` option instead. Any conflicts that arise must be resolved manually.

11.4.3 Transferring Files with Unison

Before using Unison to synchronize files and directories between different computers, make sure that the following requirements are met:

1. The package `unison` is installed.
2. Enough disk space is available on your local and remote computer.
3. If you want to benefit from Unison's full potential, make sure that Unison is also installed and running on the remote computer.

In case you need help, run Unison with the `-doc topics` option to get a full list of available sections.

For permanent settings, Unison allows to create *profiles* that specify Unison preferences such as the directories (roots) to synchronize, which types of files to ignore, and other options. The profiles are stored as text files in `~/.unison` with the file extension `*.prf`.

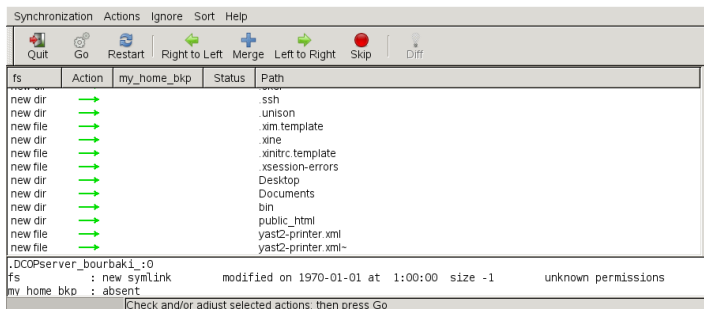

Using the GUI

To synchronize different directories with Unison's GUI, proceed as follows:

- 1 Start Unison by pressing **Alt + F2** and entering `unison`.
- 2 If you run Unison for the first time and without any further option, you are prompted for a source directory. Enter the source directory you want to synchronize and click *OK*.
- 3 Enter the target directory. It can be either local or remote. If you want to synchronize to a remote directory, choose the method (SSH, RSH or Socket) and enter the hostname and an optional user.
- 4 If you have not synchronized these two directories before, a warning dialog appears, informing you that Unison will now compare the contents of those directories. Close the warning with *OK* and wait until Unison has collected the information from both directories and displays the differences in the main window.

The left column shows the source directory you have selected, the third column shows the target directory. If there are differences between the directories, the *Action* column shows a symbol, proposing an action. A green arrow indicates that a file has been modified, added or deleted in the source or the target directory. The direction of the arrow indicates the direction that the change would be propagated if you performed the synchronization now. A question mark indicates a conflict (both files have been changed and Unison cannot decide which one to overwrite).

Figure 11.1 *File Synchronization Proposal*

- 5 To modify the proposals Unison shows for each file (for example, if you want to change the direction), select the file and click *Right to Left* or *Left to Right*. With *Skip*, exclude a file from synchronization. The symbol in the *Action* column changes accordingly.
- 6 To start the synchronization, click *Go*.

The next time you start Unison, a dialog box shows the existing profiles, each specifying a pair of directories to be synchronized. Select a profile or create a new profile (for another pair of directories) and perform the synchronization as described above.

Using the Command Line

Unison can also be operated through the command line. To synchronize a local directory to a remote computer, proceed as follows:

- 1 Open a shell and enter the following command:

```
unison -ui text DIR
          ssh://tux@jupiter.example.com//PATH
```

Replace the placeholders with the respective values.

- 2 Unison asks you what to do with your files and directories, for example:

```
local                jupiter
<----- new file   dir [f]
```

- 3 Press F if you want to follow Unison's recommendation. For other commands, press ?.
- 4 Proceed with y, if you want to propagate your updates.

11.4.4 Copying Files with FTP

Before configuring your FTP server, make sure that the following requirements are met:

1. The package `vsftp` is installed.
2. You have `root` access to your FTP server.

3. Enough disk space is available on your computer.

WARNING: For Home Networks Only

This setup is suited for use in home networks only. Do not deploy it to sites unprotected by firewalls and do not enable world wide access.

To configure an FTP server, proceed as follows:

1 Prepare the FTP server:

1a Open a shell, log in as `root`, and save a backup copy of `/etc/vsftpd.conf`:

```
cp /etc/vsftpd.conf /etc/vsftpd.conf.bak
```

1b Create an access point for anonymous FTP

```
mkdir ~ftp/incoming
chown -R ftp:ftp ~ftp/incoming
```

2 Replace the configuration files according to the preferred scenario (refer to the manual page of `vsftpd.conf` for advanced configuration options):

Allowing Anonymous Read and Write Access

```
#
listen=YES

# Enable anonymous access to FTP server
anonymous_enable=YES

#
local_enable=YES
# Enable write access
write_enable=YES
anon_upload_enable=YES
anon_mkdir_write_enable=YES
dirmessage_enable=YES
# Write log file
xferlog_enable=YES
connect_from_port_20=YES
chown_uploads=YES
chown_username=ftp
```

```
ftpd_banner=Welcome to FTP service.  
anon_root=/srv/ftp
```

Grant Restricted Permissions to FTP Users (Home Only)

```
chroot_local_users=YES
```

3 Restart the FTP server:

```
rcvsftpd start
```

On the client, just enter the URL `ftp://HOST` in your browser or FTP client. Replace *HOST* with the hostname or IP address of your server. There are many graphical user interfaces available that are suited to browsing the contents of your FTP server. For a list of them, just enter FTP at the search prompt of the YaST package manager.

11.5 Copying Files between Linux and Windows Computers with SSH

To transfer files from Linux to Windows using SSH, choose one of the following applications:

PuTTY

PuTTY is a suite of different command line tools for working with an SSH daemon. Download it from <http://www.chiark.greenend.org.uk/~sgtatham/putty.html>.

WinSCP

WinSCP is very similar to PuTTY, but includes a graphical user interface. Choose from an Explorer or Norton Commander style. Download it from <http://winscp.net>.

To copy a file from Windows to Linux with PuTTY, proceed as follows (on the Windows machine):

- 1 Start PSCP.
- 2 Enter the hostname of your SSH server.
- 3 Enter your login and password to the SSH server.

To connect from Windows to Linux with WinSCP, proceed as follows (on the Windows machine):

- 1 Start WinSCP.
- 2 Enter the hostname of the SSH server and username.
- 3 Click *Login* and acknowledge the following warning.
- 4 Drag and drop any files or directories from or to your WinSCP window.

NOTE: SSH Fingerprint

With both PuTTY and WinSCP, you must accept the SSH fingerprint when you log in for the first time.

11.6 Sharing Files between Linux Computers

The following sections feature various methods for sharing data. Use one of these if you are looking for a permanent solution for data sharing.

11.6.1 Transferring Files with NFS

To configure the server, proceed as follows:

1 Prepare the system:

1a Open a shell, log in as `root`, and grant write permissions to all users:

```
mkdir /srv/nfs
chgrp users /srv/nfs
chmod g+w /srv/nfs
```

1b Make sure that your user name and user ID is known on the client as well as on the server. Refer to [Chapter 5, *Managing Users with YaST*](#) (page 61) for detailed instructions about how to create and manage user accounts.

2 Prepare the NFS server:

2a Start YaST as `root`.

2b Select *Network Services > NFS Server* (this module is not installed by default. If it is missing in YaST, install the package `yast2-nfs-server`).

2c Enable NFS services with *Start*.

2d Open the appropriate firewall port with *Open Port in Firewall* if you are using a firewall.

3 Export the directories:

3a Click *Add directory* and select `/srv/nfs`.

3b Set the export options to:

```
rw,root_squash,async
```

3c Repeat these steps, if you need to export more than one directory.

4 Apply your settings and leave YaST. Your NFS server is ready to use.

To manually start the NFS server, enter `rcnfsserver start` as `root`. To stop the server, enter `rcnfsserver stop`. By default, YaST takes care of starting this service at boot time.

To configure the client, proceed as follows:

1 Prepare the NFS client:

1a Start YaST as `root`.

1b Select *Network Services > NFS Client*.

1c Activate *Open Port in Firewall* if using a firewall.

2 Import the remote file system:

2a Click *Add*.

2b Enter the name or IP address of the NFS server or click *Choose* to automatically scan the network for NFS servers.

2c Enter the name of your remote file system or automatically choose it with *Select*.

2d Enter an appropriate mount point, for example `/mnt`.

2e Repeat these steps, if you need to import more than one external directory.

3 Apply your settings and leave YaST. Your NFS client is ready to use.

To start the NFS client manually, enter `rcnfs start`.

NOTE: Consistent User Names

If your home network is used by just a small number of users, set up identical users manually on all machines. If, however, you need a larger consistent user base across a larger home network, consider using NIS or LDAP to manage user

data. For further information, refer to Chapter 25, *Using NIS* (↑Reference) and Chapter 26, *LDAP—A Directory Service* (↑Reference).

11.6.2 Sharing Files with Samba

This section introduces various methods to access files on a Samba server. Both KDE and GNOME ship with graphical tools for working with Samba shares. There is also a command line tool for accessing Samba servers.

Accessing Shares with KDE and GNOME

Both the KDE and GNOME desktops can access Samba shares through their file browsers. To access your share, proceed as follows:

- 1 Press Alt + F2 and enter `smb://jupiter.example.com/share`.

The syntax of this URL is `smb://HOST/SHARENAME` with *HOST* representing the hostname (`jupiter.example.com`) or IP address and *SHARENAME* representing the share. See [Step 3b](#) (page 181).

- 2 Log in with the username and password. The password is set in [Step 4](#) (page 181) or just hit Enter if no password is needed.
- 3 Drag and drop any files or directories from or to your window.

If you do not know your workgroup, enter `smb:/` to list all workgroups available in your network. The Smb4K tool (package `smb4k`) can also be used to display all workgroups in your network and mount them on demand.

Accessing Shares from the Command Line

If you prefer using the command line, use the `smbclient` command. To log in to your Samba server, run:

```
smbclient //jupiter/share -U tux
```

Omit the `-U` option if you are the current user `tux`. After logging in successfully, use some basic commands like `ls` (list contents), `mkdir` (create directory), `get` (download

file), and `put` (upload file). Use `help` to display all commands. Refer to the manual page of `smbclient` for more information.

11.7 Sharing Files between Linux and Windows with Samba

Samba is the first choice for transferring files between Windows and Linux machines. These are the most common use cases for Samba:

Transferring Files from Linux to Windows with the SMB Scheme

In the easiest case you do not have to configure a Linux server. Use the `smb://` scheme. For more information, see [Section “Accessing Shares with KDE and GNOME”](#) (page 179). Make sure that your workgroup is identical on both systems and that your directories are shared.

Transferring Files from Windows to Linux Using a Server

Configure a Samba server on your Linux computer. See [Setting Up a Samba Server](#) (page 180).

TIP: Using Default Registry Entries for Your Windows System

Some Windows versions (95, 98) require a small change in the registry for enabling a different password authentication method. Simplify this step by installing the `samba-doc` package and copy the file `/usr/share/doc/packages/samba/registry` to your Windows drive. Start Windows and incorporate the changes by double-clicking on this file.

Procedure 11.2 *Setting Up a Samba Server*

To set up a Samba server, do the following:

1 Prepare the Samba server:

1a Start YaST as `root`.

1b Install the `samba` package.

- 1c** Create a directory, for example, `/srv/share`.
 - 2** Create the server configuration:
 - 2a** Select *Network Services > Samba Server*.
 - 2b** Select one of the workgroups or enter a new one, for example, `Penguin`.
 - 2c** Check *Primary Domain Controller (PDC)*
 - 2d** Set *During Boot* if the Samba service should be started every time your computer boots. Otherwise set *Manually*.
 - 2e** Activate *Open Port in Firewall* if you use a firewall.
 - 3** Create your Windows share:
 - 3a** Change to the *Shares* tab and click *Add*.
 - 3b** Enter a name and description. The *Share Name* is used for accessing the share from your clients. *Share Description* describes the purpose of the share.
 - 3c** Select your path, for example, `/src/share`.
 - 3d** Proceed with *OK*.
 - 3e** Activate *Allow Users to Share Their Directories*.
 - 4** Provide a password for all users that are allowed to use this service:

```
smbpasswd -a tux
```

For easier configuration, just hit **Enter** to leave the password empty. Take into account that the usernames on your Windows and Linux computers are probably different. Configuring a consistent user base for both Windows and Linux is beyond the scope of this document.
 - 5** Start the Samba server:

```
rcnmb start
rcsmb start
```

To check if everything has been successfully configured, enter:

```
smbclient -L localhost
```

After you hit Enter, you should get something like the following:

```
Anonymous login successful
Domain=[PENGUIN] OS=[Unix] Server=[Samba 3.0.22-11-SUSE-CODE10]

  Sharename      Type      Comment
  -----
  share          Disk     Shared directory
  netlogon       Disk     Network Logon Service
  IPC$           IPC      IPC Service (Samba 3.0.22-11-SUSE-CODE10)
  ADMIN$         IPC      IPC Service (Samba 3.0.22-11-SUSE-CODE10)
Anonymous login successful
Domain=[PENGUIN] OS=[Unix] Server=[Samba 3.0.22-11-SUSE-CODE10]

  Server          Comment
  -----
  SUSE-DESKTOP    Samba 3.0.22-11-SUSE-CODE10

  Workgroup       Master
  -----
  TUX-NET         jupiter
```

Part IV. Help and Troubleshooting

Help and Documentation

openSUSE® comes with various sources of information and documentation, many of which are already integrated in your installed system:

Desktop Help Centers

The help centers of both the KDE desktop (KDE help center) and the GNOME desktop (Yelp) provide central access to the most important documentation resources on your system in searchable form. These resources include online help for installed applications, man pages, info pages, and the Novell/SUSE manuals delivered with your product. Learn more about your desktop's help center in [Section 12.1, “Using the KDE Help Center”](#) (page 186) and [Section 12.2, “Using GNOME Yelp”](#) (page 188).

Separate Help Packages for Some Applications

When installing new software with YaST, the software documentation is installed automatically in most cases and usually appears in the help center of your desktop. However, some applications, such as The GIMP, may have different online help packages that can be installed separately with YaST and do not integrate into the help centers.

Documentation in `/usr/share/doc`

This traditional help directory holds various documentation files and the release notes for your system. Find more detailed information in Section “Documentation Directory” (Chapter 39, *Help and Documentation*, ↑Reference).

Man Pages and Info Pages for Shell Commands

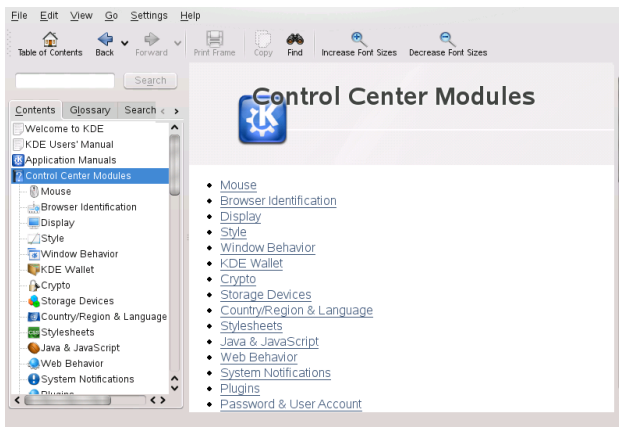

When working with the shell, you do not need to know the options of the commands by heart. Traditionally, the shell provides integrated help by means of man pages

and info pages. Read more in Section “Man Pages” (Chapter 39, *Help and Documentation*, ↑Reference) and Section “Info Pages” (Chapter 39, *Help and Documentation*, ↑Reference).

12.1 Using the KDE Help Center

From the KDE desktop, you can access the KDE help center in various ways: If you need information from within an application, simply click the application's *Help* button or press F1 to open the application's documentation in the help center. If you start the help center from the main menu, or from the command line with `khelppcenter`, you are taken to the main window of the help center from which you can browse the help topics.

Figure 12.1 *Main Window of the KDE Help Center*

The menu and the toolbar provide options for printing contents from the help center, searching the currently displayed page, and navigating and customizing the help center. The display field in the right part of the window always shows the currently selected contents, such as online manuals, search results, or Web pages.

The navigation area in the left part of the window contains several tabs:

Contents

Presents a tree view of all available information sources. The help center addresses various target groups, such as users, administrators, and developers. Click the book

icons to open and browse the individual categories. Under the heading *Administration*, for example, you can also browse man (manual) and info (information) pages associated with command line programs. The help center also provides access to some online databases that cover special hardware and software issues for your product. All these sources can be searched conveniently once a search index has been generated.

The contents of your help center depends on which software packages are currently installed and which languages are selected as your system languages.

Glossary

Provides a quick reference where you can look up the definitions of words that might be unfamiliar to you.

Search Options

Holds options for the full text search of the help center. You can combine several search criteria.

Procedure 12.1 *Searching the Help Center*

To use the full text search KDE help center offers, generate a search index and set the search parameters. If the search index has not yet been generated, the system automatically prompts you to do so when you click the *Search* tab.

- 1** To search for a term, click into the text field and enter the search string.
- 2** To combine your search strings with operands, click *Method* and select the operand to use.
- 3** Choose an option from *Max. Results* to limit the number of hits to display.
- 4** To restrict your search to certain types of documentation, choose an option from *Scope selection*. With *Default*, a predefined selection of documents is searched. *All* includes all types of documents in the search. *Custom* lets you define which documents to include in your search. Just activate the documents you want in the list.
- 5** When you have set the options according to your wishes, click *Search*. The search results are then displayed as a list of links in the display field and can be navigated with mouse clicks.

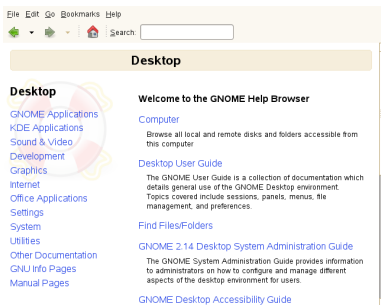

Procedure 12.2 *Generating a New Search Index*

- 1 To create a new search index, select *Settings > Build Search Index* from the menu. A window opens, showing a list of documentation currently available in the help center.
- 2 Select the documents to integrate in the search index and click *Build Index*. After the index has been generated, you can use the full text search.

12.2 Using GNOME Yelp

On the GNOME desktop, to start Yelp directly from an application, either click the *Help* button or press F1. Both options take you directly to the application's documentation in the help center. However, you can also start Yelp from the main menu, or from the command line with `yelp` and then browse through the main window of the help center.

Figure 12.2 *Main Window of Yelp*

The menu and the toolbar provide options for navigating and customizing the help center, for searching and for printing contents from Yelp. To view a table of contents, click *Help Topics*. The help topics are grouped into categories presented as links. Click one of the links to open a list of topics for that category. To search for an item, just enter the search string into the search field at the top of the window.

12.3 Browsing Man and Info Pages From Your Desktop

With KDE or GNOME desktop, you can also access (or print) man pages and info pages:

KDE

In Konqueror, to view the man page for `ls`, type `man : /ls` in the location bar. If there are different categories for a command, Konqueror displays them as links.

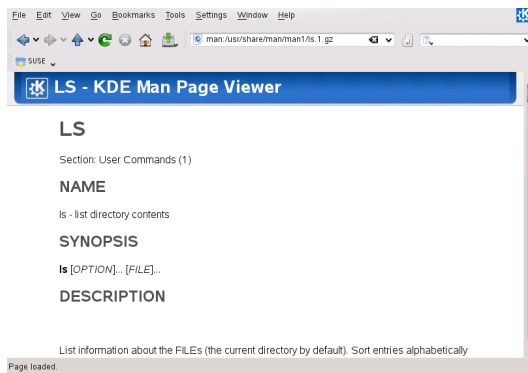

To display the info page for `grep`, for example, type `info : /grep`.

In the KDE help center, check out *Administration* in the table of contents to browse man pages and info pages.

GNOME

Run `yelp man:ls` or `yelp info:ls` to display the man or info page.

Figure 12.3 Viewing a Man Page With Konqueror

12.4 Additional Help Resources

In addition to the online versions of the Novell/SUSE manuals installed under `/usr/share/doc`, you can also access the product-specific manuals and documentation on the Web. For an overview of all documentation available for your product check out

your product-specific documentation Web page at <http://www.novell.com/documentation/>.

If you are searching for additional product-related information, you can also refer to the following Web sites:

- openSUSE Wiki English [<http://en.opensuse.org>] and <http://www.opensuse.org>
- SUSE Support Database [<http://en.opensuse.org/SDB:SDB>]
- Novell Technical Support Knowledgebase [<http://www.novell.com/support/>]
- Product Support Community Resources [<http://support.novell.com/forums/index.html>]
- KDE Documentation Web site [<http://www.kde.org/documentation>]
- Documentation Web site for KDE applications [<http://www.kde-apps.org>]
- GNOME Documentation Web site [<http://www.gnome.org/learn/>]

You might also want to try general-purpose search engines. For example, you might try the search terms `Linux CD-RW help` or `OpenOffice file conversion problem` if you were having trouble with the CD burning or with OpenOffice.org file conversion. Google™ also has a specific Linux search engine at <http://www.google.com/linux> that you might find useful.

12.5 For More Information

Apart from the product-specific help resources, there is a broad range of information available for Linux topics.

12.5.1 Online Resources for openSUSE

The openSUSE community are helpful people. If you have a specific question you can write to several mailing lists, communicate with Internet Relay Chat (IRC), or browse through Web Forums. Find more information at <http://en.opensuse.org/Communicate>.

12.5.2 The Linux Documentation Project

The Linux Documentation Project (TLDP) is run by a team of volunteers who write Linux-related documentation (see <http://www.tldp.org>). The set of documents contains tutorials for beginners, but is mainly focused on experienced users and professional system administrators. TLDP publishes HOWTOs, FAQs, and guides (handbooks) under a free license.

HOWTOs

HOWTOs are usually a short, informal, step-by-step guides to accomplishing specific tasks. HOWTOs can be found in the package `howto` and are installed under `/usr/share/doc/howto`

Frequently Asked Questions

FAQs (frequently asked questions) are a series of questions and answers. They originate from Usenet newsgroups where the purpose was to reduce continuous reposting of the same basic questions.

Guides

Manuals and guides for various topics or programs can be found at <http://www.tldp.org/guides.html>. They range from *Bash Guide for Beginners* to *Linux Filesystem Hierarchy* to *Linux Administrator's Security Guide*. Generally, guides are more detailed and exhaustive than a HOWTO or FAQ. They are usually written by experts for experts. Some of these books are old but still valid and ship with openSUSE. Search and install these books and guides with YaST.

12.5.3 Usenet

Created in 1979 before the rise of the Internet, Usenet is one of the oldest computer networks and still in active use. The format and transmission of Usenet articles is very similar to e-mail, but is developed for a many-to-many communication.

Usenet is organized into seven topical categories: `comp.*` for computer-related discussions, `misc.*` for miscellaneous topics, `news.*` for newsgroup-related matters, `rec.*` for recreation and entertainment, `sci.*` for science-related discussions, `soc.*` for social discussions, and `talk.*` for various controversial topics. The top levels are split in subgroups. For instance, `comp.os.linux.hardware` is a newsgroup for Linux-specific hardware issues.

Before you can post an article, have your client connect to a news server and subscribe to a specific newsgroup. News clients include Knode or Evolution. Each news server communicates to other news servers and exchanges articles with them. Not all newsgroups may be available on your news server.

Interesting newsgroups for Linux users are `comp.os.linux.apps`, `comp.os.linux.questions`, and `comp.os.linux.hardware`. If you cannot find a specific newsgroup, go to <http://www.linux.org/docs/usenetlinux.html>. Follow the general Usenet rules available online at <http://www.faqs.org/faqs/usenet/posting-rules/part1/>.

12.5.4 Wikipedia: The Free Online Encyclopedia

Wikipedia is “a multilingual encyclopedia designed to be read and edited by anyone” (see <http://en.wikipedia.org>). The content of Wikipedia is created by its users and is published under a free license (GFDL). Any visitor can edit articles.

12.5.5 Standards and Specifications

There are various sources that provide information about standards or specifications.

<http://www.linux-foundation.org/en/LSB>

The Linux Foundation is an independent nonprofit organization that promotes the distribution of free software and open source software. The organization endeavors to achieve this by defining distribution-independent standards. The maintenance of several standards, such as the important LSB (Linux Standard Base), is supervised by this organization.

<http://www.w3.org>

The World Wide Web Consortium (W3C) is one of the best-known standards organizations. It was founded in October 1994 by Tim Berners-Lee and concentrates on standardizing Web technologies. W3C promotes the dissemination of open, license-free, and manufacturer-independent specifications, such as HTML, XHTML, and XML. These Web standards are developed in a four-stage process in *working groups* and are presented to the public as *W3C recommendations* (REC).

<http://www.oasis-open.org>

OASIS (Organization for the Advancement of Structured Information Standards) is an international consortium specializing in the development of standards for Web security, e-business, business transactions, logistics, and interoperability between various markets.

<http://www.ietf.org>

The Internet Engineering Task Force (IETF) is an internationally active cooperative of researchers, network designers, suppliers, and users. It concentrates on the development of Internet architecture and the smooth operation of the Internet by means of protocols.

Every IETF standard is published as an RFC (Request for Comments) and is available free-of-charge. There are six types of RFC: proposed standards, draft standards, Internet standards, experimental protocols, information documents, and historic standards. Only the first three (proposed, draft, and full) are IETF standards in the narrower sense (see <http://www.ietf.org/rfc/rfc1796.txt>).

<http://www.ieee.org>

The Institute of Electrical and Electronics Engineers (IEEE) is an organization that draws up standards in the areas of information technology, telecommunication, medicine and health care, transport, and others. IEEE standards are subject to a fee.

<http://www.iso.org>

The ISO Committee (International Organization for Standards) is the world's largest developer of standards and maintains a network of national standardization institutes in over 140 countries. ISO standards are subject to a fee.

<http://www.din.de> , <http://www.din.com>

The Deutsches Institut für Normung (DIN) is a registered technical and scientific association. It was founded in 1917. According to DIN, the organization is “the institution responsible for standards in Germany and represents German interests in worldwide and European standards organizations.”

The association brings together manufacturers, consumers, trade professionals, service companies, scientists and others who have an interest in the establishment of standards. The standards are subject to a fee and can be ordered using the DIN home page.

12.6 Support for openSUSE

Useful support information for openSUSE is available in a number of sources.

- Free installation support for retail box customer
- Free community support <http://en.opensuse.org/Communicate>

If you encounter problems with the installation or use of openSUSE that you are unable to solve, our experienced support staff can offer practical assistance with the free installation support for registered releases. Nearly all common customer problems can be eliminated quickly and competently. You can use the extensive support offered through the community as well.

12.6.1 Free Installation Support

Our free installation support is provided for a period of 90 days following the activation of your registration code or following the release of the next version. If you cannot find an answer to your question in any of the available information sources, we will gladly provide assistance for the following issues:

- Installation on a typical home user system or laptop equipped with a single processor, at least 512 MB RAM, and 3 GB of free hard disk space.
- Resizing of one Windows partition that occupies the entire hard disk.
- Dual-boot installation with Windows, limited to Linux Support.
- Installation of a local ATAPI CD or DVD drive.
- Installation from a remote CD/DVD drive
- Installation on the first or second hard disk in an IDE-only system (`/dev/sda` or `/dev/sdb`) or supported S-ATA system, excluding RAID.
- Integration of a standard keyboard and standard mouse.
- Configuration of the graphical user interface (without the hardware acceleration feature of the graphics card).
- Installation of the boot manager in the MBR of the first hard disk without modifying the BIOS mapping.
- Setup of Internet access with a supported PCI ISDN card or external serial modem (not USB). Alternatively, setup of DSL based on PPPoE with a supported NIC.
- Basic configuration of a supported WLAN adapter.
- Basic configuration of an ALSA-supported PCI sound card.
- Basic configuration of a locally-attached compatible printer with YaST.
- Basic configuration of an IDE CD writer for use with k3b (CD burning application) without changing the jumper setting.

- Configuration of a supported PCI ethernet card for LAN access with either DHCP (client) or static IP. This does not include the configuration of the LAN or any other computers or network components. It also does not cover the configuration of the computer as a router. Fault analysis is limited to checking for proper loading of the kernel module and the correct local network settings.
- Configuration of an e-mail client (Evolution or KMail) for collecting mail from a POP3 account. Fault analysis is limited to checking for proper settings in the e-mail client.
- Support for the package selection GNOME Desktop or KDE Desktop.
- Upgrade from the previous version of the product.
- Kernel updates (only official Novell update RPMs).
- Installation of bug fixes and security updates from the official update server using online update or the manual method.

For a detailed listing of the subjects covered by the free installation support, check http://support.novell.com/products/suselinux/support_overview.html.

In case you are not sure if your support is covered, please do not hesitate to give us a call. We are happy to assist.

Contact Information for Free Installation Support

Reach our support staff under the following links and phone numbers. Our installation support is offered through call back. After your problem description our staff either tries to call you back in the next 2 hours or arrange a time for a call back.

- <http://support.novell.com/eService>
- United States and Canada: Phone: +1-800-796-3700 (Monday through Friday from 04:30 a.m. to 12:00 noon EST)
- Germany, Austria, Switzerland: Phone: +49 (0)911-9900-6000 (Monday through Friday from 10:30 to 18:00 CET)
- UK: Phone: +44-1344-326-666 (Monday through Friday from 09:30 to 17:00 GMT)

- All other countries (English only): Phone: +44-1344-326-666 (Monday through Friday from 10:30 to 18:00 CET)

For the most recent contact information, refer to <http://support.novell.com/products/suselinux/contact.html>.

Important Notes

1. Free installation support is offered to customers with a valid, activated registration code. You can activate your registration code at <http://www.novell.com/usersupport>.
2. The registration code is not transferable to another person.
3. The free support covers the initial installation on one computer. Refer to our Web site for further information http://support.novell.com/products/opensuse/support_overview.html.

Contact Recommendations

We recommend to use <http://support.novell.com/eService> to open a service request and to provide us with the relevant information like problem description and log files. It helps us to avoid misspelled commands, links, or directory names, which often cause frustrating problems and are particularly common during phone conversations. You will receive a reply soon providing a practical solution.

12.6.2 Advanced Support

Please be aware that the phone numbers may change during the sales cycle of openSUSE 11.1. Find current numbers as well as a detailed listing of the subjects covered by the Support Service at <http://www.novell.com/usersupport>.

NOTE: Note

While our expert staff will do their best to provide top-quality support in a reasonable way, we cannot guarantee a workable solution.

12.6.3 Preparing a Support Request

We endeavor to help you as quickly and precisely as possible. The effort and time needed is considerably reduced if the question is formulated clearly. Please have answers to the following questions ready before contacting us:

1. Which program and version are you using? During which process does the problem occur?
2. What exactly is the problem? Try to describe the error as precisely as possible, using phrases with words such as *when* (for example, “When X is pressed, this error appears”).
3. What hardware do you use (graphics card, monitor, printer, ISDN card, etc.)? You can get this information from the YaST *Hardware Information* module.

Detailed documentation can be found in manuals, online help, and the Support Database. These comprehensive documentation of openSUSE gives guidance to solve a variety of problems. The SUSE Help Center on your desktop provides additional information about installed packages, the vital HOWTOs, and info pages.

You can access the latest Support Database articles online at <http://www.novell.com/usersupport> or access the community Support Database at <http://en.opensuse.org/SDB>. The Support Database, one of the most frequently used databases in the Linux world, offers our customers a wealth of analysis and solution approaches. You can retrieve tested solutions using the keyword search, history function, or version-dependent search.

Common Problems and Their Solutions

13

This chapter offers a range of common problems that can arise with an intention of covering as many of the various types of potential problems as possible. That way, even if your precise situation is not listed here, there might be one similar enough to offer hints as to the solution.

13.1 Finding and Gathering Information

Linux logs things in a fair amount of detail. There are several places to look when you have problems with your system, most of which are standard to Linux systems in general and some of which are peculiar to openSUSE systems. Most log files can also be viewed with YaST (*Miscellaneous > Start-Up Log*).

YaST offers the possibility to collect all system information needed by the support team. Use *Miscellaneous > Support Query*. Select the problem category. When all information is gathered, attach it to your support request.

The following is a list of the most commonly checked log files and what they typically contain.

Table 13.1 *Log Files*

Log File	Description
<code>~/.xsession-errors</code>	Messages from the desktop applications currently running. The <code>~</code> is the home directory of the current user.
<code>/var/log/apparmor/</code>	Log files from AppArmor, see Novell AppArmor Administration Guide (↑Novell AppArmor Administration Guide) for detailed information.
<code>/var/log/audit/audit.log</code>	Log file from Audit to track any access to files, directories, or resources of your system and trace system calls.
<code>/var/log/boot.msg</code>	Messages from the kernel during the boot process.
<code>/var/log/mail.*</code>	Messages from the mail system.
<code>/var/log/messages</code>	Ongoing messages from the kernel and system log daemon when running.
<code>/var/log/NetworkManager</code>	Log file from NetworkManager to collect problems with network connectivity
<code>/var/log/samba/</code>	Directory containing Samba server and client log messages.
<code>/var/log/SaX.log</code>	Hardware messages from the SaX display and KVM system.
<code>/var/log/warn</code>	All messages from the kernel and system log daemon assigned WARNING level or higher.
<code>/var/log/wtmp</code>	Binary file containing user login records for the current machine session. View it with <code>last</code> .

Log File	Description
<code>/var/log/Xorg.*.log</code>	Various start-up and runtime logs from the X Window system. It is useful for debugging failed X start-ups.
<code>/var/log/YaST2/</code>	Directory containing YaST's actions and their results.
<code>/var/log/zypper.log</code>	Log file of zypper.

Apart from log files, your machine also supplies you with information about the running system. See [Table 13.2: System Information](#)

Table 13.2 *System Information*

File	Description
<code>/proc/cpuinfo</code>	This displays processor information, including its type, make, model, and performance.
<code>/proc/dma</code>	This shows which DMA channels are currently being used.
<code>/proc/interrupts</code>	This shows which interrupts are in use and how many of each have been in use.
<code>/proc/iomem</code>	This displays the status of I/O (input/output) memory.
<code>/proc/ioports</code>	This shows which I/O ports are in use at the moment.
<code>/proc/meminfo</code>	This displays memory status.
<code>/proc/modules</code>	This displays the individual modules.
<code>/proc/mounts</code>	This displays devices currently mounted.

File	Description
<code>/proc/partitions</code>	This shows the partitioning of all hard disks.
<code>/proc/version</code>	This displays the current version of Linux.

Linux comes with a number of tools for system analysis and monitoring. See Chapter 11, *System Monitoring Utilities* (↑Reference) for a selection of the most important ones used in system diagnostics.

Each scenario included in the following begins with a header describing the problem followed by a paragraph or two offering suggested solutions, available references for more detailed solutions, and cross-references to other scenarios that might be related.

13.2 Installation Problems

Installation problems are situations when a machine fails to install. It may fail entirely or it may not be able to start the graphical installer. This section highlights some of the typical problems you might run into and offers possible solutions or workarounds for this kind of situations.

13.2.1 Checking Media

If you encounter any problems using the openSUSE installation media, check the integrity of your installation media with *Software > Media Check*. Media problems are more likely to occur with media you burn yourself. To check an openSUSE medium, insert it into the drive and click *Start* for YaST to check the checksum of the medium. This may take several minutes. If errors are detected, do not use this medium for installation.

13.2.2 Hardware Information

Display detected hardware and technical data using *Hardware > Hardware Information*. Click any node of the tree for more information about a device. This module is especially

useful, for example, when submitting a support request for which you need information about your hardware.

Save the hardware information displayed to a file by clicking *Save to File*. Select the desired directory and filename then click *Save* to create the file.

13.2.3 No Bootable DVD Drive Available

If your computer does not contain a bootable DVD-ROM drive or if the one you have is not supported by Linux, there are several options for installing your machine without a need for a built-in DVD drive:

Booting from a Floppy Disk

Create a boot floppy and boot from floppy disk instead of DVD.

Using an External Boot Device

If it is supported by the machine's BIOS and the installation kernel, boot for installation from external DVD drives.

Network Boot via PXE

If a machine lacks a DVD drive, but provides a working ethernet connection, perform a completely network-based installation. See Section “Remote Installation via VNC—PXE Boot and Wake on LAN” (Chapter 1, *Remote Installation*, ↑Reference) and Section “Remote Installation via SSH—PXE Boot and Wake on LAN” (Chapter 1, *Remote Installation*, ↑Reference) for details.

Booting from a Floppy Disk (SYSLINUX)

On some older computers, there is no bootable DVD drive available, but a floppy disk drive. To install on such a system, create boot disks and boot your system with them.

The boot disks include the loader SYSLINUX and the program linuxrc. SYSLINUX enables the selection of a kernel during the boot procedure and the specification of any parameters needed for the hardware used. The program linuxrc supports the loading of kernel modules for your hardware and subsequently starts the installation.

When booting from a boot disk, the boot procedure is initiated by the boot loader SYSLINUX (package `syslinux`). When the system is booted, SYSLINUX runs a minimum hardware detection that mainly consists of the following steps:

1. The program checks if the BIOS provides VESA 2.0–compliant framebuffer support and boots the kernel accordingly.
2. The monitor data (DDC info) is read.
3. The first block of the first hard disk (MBR) is read to map BIOS IDs to Linux device names during the boot loader configuration. The program attempts to read the block by means of the the lba32 functions of the BIOS to determine if the BIOS supports these functions.

If you keep Shift pressed when SYSLINUX starts, all these steps are skipped. For troubleshooting purposes, insert the line

```
verbose 1
```

in `syslinux.cfg` for the boot loader to display which action is currently being performed.

If the machine does not boot from the floppy disk, you may need to change the boot sequence in the BIOS to *A, C, CDROM*.

External Boot Devices

Most DVD drives are supported. If the system does not have one or floppy disk, it is still possible that an external DVD drive, connected with USB, FireWire, or SCSI, can be used to boot the system. This depends largely on the interaction of the BIOS and the hardware used. Sometimes a BIOS update may help if you encounter problems.

13.2.4 Booting from Installation Media Fails

One reason for a machine not to boot for installation is an incorrect boot sequence in BIOS. The BIOS boot sequence must have DVD drive set as the first entry for booting. Otherwise the machine would try to boot from another medium, typically the hard disk. Guidance for changing the BIOS boot sequence can be found the documentation provided with your motherboard or in the following paragraphs.

The BIOS is the software that enables the very basic functions of a computer. Motherboard vendors provide a BIOS specifically made for their hardware. Normally, the BIOS setup can only be accessed at a specific time—when the machine is booting. During this initialization phase, the machine performs a number of diagnostic hardware

tests. One of them is a memory check, indicated by a memory counter. When the counter appears, look for a line, usually below the counter or somewhere at the bottom, mentioning the key to press to access the BIOS setup. Usually the key to press is Del, F1, or Esc. Press this key until the BIOS setup screen appears.

Procedure 13.1 *Changing the BIOS Boot Sequence*

- 1 Enter the BIOS using the proper key as announced by the boot routines and wait for the BIOS screen to appear.
- 2 To change the boot sequence in an AWARD BIOS, look for the *BIOS FEATURES SETUP* entry. Other manufacturers may have a different name for this, such as *ADVANCED CMOS SETUP*. When you have found the entry, select it and confirm with Enter.
- 3 In the screen that opens, look for a subentry called *BOOT SEQUENCE*. The boot sequence is often set to something like C, A or A, C. In the former case, the machine first searches the hard disk (C) then the floppy drive (A) to find a bootable medium. Change the settings by pressing PgUp or PgDown until the sequence is A, CDROM, C.
- 4 Leave the BIOS setup screen by pressing Esc. To save the changes, select *SAVE & EXIT SETUP* or press F10. To confirm that your settings should be saved, press Y.

Procedure 13.2 *Changing the Boot Sequence in a SCSI BIOS (Adaptec Host Adapter)*

- 1 Open the setup by pressing Ctrl + A.
- 2 Select *Disk Utilities*, which displays the connected hardware components.
Make note of the SCSI ID of your DVD drive.
- 3 Exit the menu with Esc.
- 4 Open *Configure Adapter Settings*. Under *Additional Options*, select *Boot Device Options* and press Enter.
- 5 Enter the ID of the DVD drive and press Enter again.

- 6 Press Esc twice to return to the start screen of the SCSI BIOS.
- 7 Exit this screen and confirm with *Yes* to boot the computer.

Regardless of what language and keyboard layout your final installation will be using, most BIOS configurations use the US keyboard layout as depicted in the following figure:

Figure 13.1 *US Keyboard Layout*

13.2.5 Fails to Boot

Some hardware types, mainly fairly old or very recent ones, fail to install. In many cases, this might happen because support for this type of hardware is missing from the installation kernel or due to certain functionality included in this kernel, such as ACPI, that still cause problems on some hardware.

If your system fails to install using the standard *Installation* mode from the first installation boot screen, try the following:

- 1 With the DVD still in the drive, reboot the machine with Ctrl + Alt + Del or using the hardware reset button.
- 2 When the boot screen appears, use the arrow keys of your keyboard to navigate to *Installation–ACPI Disabled* and press Enter to launch the boot and installation process. This option disables the support for ACPI power management techniques.
- 3 Proceed with the installation as described in [Chapter 1, *Installation with YaST*](#) (page 3).

If this fails, proceed as above, but choose *Installation--Safe Settings* instead. This option disables ACPI and DMA support. Most hardware should boot with this option.

If both of these options fail, use the boot options prompt to pass any additional parameters needed to support this type of hardware to the installation kernel. For more information about the parameters available as boot options, refer to the kernel documentation located in `/usr/src/linux/Documentation/kernel-parameters.txt`.

TIP: Obtaining Kernel Documentation

Install the `kernel-source` package to view the kernel documentation.

There are various other ACPI-related kernel parameters that can be entered at the boot prompt prior to booting for installation:

`acpi=off`

This parameter disables the complete ACPI subsystem on your computer. This may be useful if your computer cannot handle ACPI at all or if you think ACPI in your computer causes trouble.

`acpi=force`

Always enable ACPI even if your computer has an old BIOS dated before the year 2000. This parameter also enables ACPI if it is set in addition to `acpi=off`.

`acpi=noirq`

Do not use ACPI for IRQ routing.

`acpi=ht`

Run only enough ACPI to enable hyper-threading.

`acpi=strict`

Be less tolerant of platforms that are not strictly ACPI specification compliant.

`pci=noacpi`

Disable PCI IRQ routing of the new ACPI system.

`pnpacpi=off`

This option is for serial or parallel problems when your BIOS setup contains wrong interrupts or ports.

`notsc`

Disable the time stamp counter. This option can be used to work around timing problems on your systems. It is a new feature, if you see regressions on your machine, especially time related or even total hangs, this option is worth a try.

`nohz=off`

Disable the nohz feature. If your machine hangs, this option might help. Generally, you do not need it.

Once you have determined the right parameter combination, YaST automatically writes them to the boot loader configuration to make sure that the system boots properly next time.

If unexplainable errors occur when the kernel is loaded or during the installation, select *Memory Test* in the boot menu to check the memory. If *Memory Test* returns an error, it is usually a hardware error.

13.2.6 Fails to Launch Graphical Installer

After you insert the medium into your drive and reboot your machine, the installation screen comes up, but after you select *Installation*, the graphical installer does not start.

There are several ways to deal with this situation:

- Try to select another screen resolution for the installation dialogs.
- Select *Text Mode* for installation.
- Do a remote installation via VNC using the graphical installer.

Procedure 13.3 *Change Screen Resolution for Installation*

- 1 Boot for installation.
- 2 Press F3 to open a menu from which to select a lower resolution for installation purposes.
- 3 Select *Installation* and proceed with the installation as described in [Chapter 1, *Installation with YaST*](#) (page 3).

Procedure 13.4 *Installation in Text Mode*

- 1 Boot for installation.
- 2 Press F3 and select *Text Mode*.
- 3 Select *Installation* and proceed with the installation as described in [Chapter 1, *Installation with YaST*](#) (page 3).

Procedure 13.5 *VNC Installation*

- 1 Boot for installation.
- 2 Enter the following text at the boot options prompt:

```
vnc=1 vncpassword=some_password
```

Replace *some_password* with the password to use for installation.

- 3 Select *Installation* then press Enter to start the installation.

Instead of starting right into the graphical installation routine, the system continues to run in text mode then halts, displaying a message containing the IP address and port number at which the installer can be reached via a browser interface or a VNC viewer application.

- 4 If using a browser to access the installer, launch the browser and enter the address information provided by the installation routines on the future openSUSE machine and hit Enter:

```
http://ip_address_of_machine:5801
```

A dialog opens in the browser window prompting you for the VNC password. Enter it and proceed with the installation as described in [Chapter 1, *Installation with YaST*](#) (page 3).

IMPORTANT

Installation via VNC works with any browser under any operating system, provided Java support is enabled.

If you use any kind of VNC viewer on your preferred operating system, enter the IP address and password when prompted to do so. A window opens, displaying the installation dialogs. Proceed with the installation as usual.

13.2.7 Only Minimalistic Boot Screen Started

You inserted the medium into the drive, the BIOS routines are finished, but the system does not start with the graphical boot screen. Instead it launches a very minimalistic text-based interface. This might happen on any machine not providing sufficient graphics memory for rendering a graphical boot screen.

Although the text boot screen looks minimalistic, it provides nearly the same functionality as the graphical one:

Boot Options

Unlike the graphical interface, the different boot options cannot be selected using the cursor keys of your keyboard. The boot menu of the text mode boot screen offers some keywords to enter at the boot prompt. These keywords map to the options offered in the graphical version. Enter your choice and hit Enter to launch the boot process.

Custom Boot Options

After selecting a boot option, enter the appropriate keyword at the boot prompt or enter some custom boot options as described in [Section 13.2.5, “Fails to Boot”](#) (page 206). To launch the installation process, press Enter.

Screen Resolutions

Use the F keys to determine the screen resolution for installation. If you need to boot in text mode, choose F3.

13.3 Boot Problems

Boot problems are situations when your system does not boot properly (does not boot to the expected runlevel and login screen).

13.3.1 Fails to Load the GRUB Boot Loader

If the hardware is functioning properly, it is possible that the boot loader has become corrupted and Linux cannot start on the machine. In this case, it is necessary to reinstall the boot loader. To reinstall the boot loader, proceed as follows:

- 1 Insert the installation media into the drive.
- 2 Reboot the machine.
- 3 Select *Installation* from the boot menu.
- 4 Select a language.
- 5 Accept the license agreement.
- 6 In the *Installation Mode* screen, select *Other* and set the installation mode to *Repair Installed System*.
- 7 Once in the YaST System Repair module, select *Expert Tools* then select *Install New Boot Loader*.
- 8 Restore the original settings and reinstall the boot loader.
- 9 Leave YaST System Repair and reboot the system.

Other reasons for the machine not booting may be BIOS-related:

BIOS Settings

Check your BIOS for references to your hard drive. GRUB might simply not be started if the hard drive itself cannot be found with the current BIOS settings.

BIOS Boot Order

Check whether your system's boot order includes the hard disk. If the hard disk option was not enabled, your system might install properly, but fail to boot when access to the hard disk is required.

13.3.2 No Graphical Login

If the machine comes up, but does not boot into the graphical login manager, anticipate problems either with the choice of the default runlevel or the configuration of the X Window System. To check the runlevel configuration, log in as the `root` user and check whether the machine is configured to boot into runlevel 5 (graphical desktop). A quick way to check this is to examine the contents of `/etc/inittab`, as follows:

```
nld-machine:~ # grep "id:" /etc/inittab
id:5:initdefault:
nld-machine:~ #
```

The returned line indicates that the machine's default runlevel (`initdefault`) is set to 5 and that it should boot to the graphical desktop. If the runlevel is set to any other number, use the YaST Runlevel Editor module to set it to 5.

IMPORTANT

Do not edit the runlevel configuration manually. Otherwise `SuSEconfig` (run by YaST) will overwrite these changes on its next run. If you need to make manual changes here, disable future `SuSEconfig` changes by setting `CHECK_INITTAB` in `/etc/sysconfig/suseconfig` to `no`.

If the runlevel is set to 5, you might have corruption problems with your desktop or X Windows software. Examine the log files at `/var/log/Xorg.*.log` for detailed messages from the X server as it attempted to start. If the desktop fails during start, it might log error messages to `/var/log/messages`. If these error messages hint at a configuration problem in the X server, try to fix these issues. If the graphical system still does not come up, consider reinstalling the graphical desktop.

One quick test: the `startx` command should force the X Window System to start with the configured defaults if the user is currently logged in on the console. If that does not work, it should log errors to the console. For more information about the X Window system configuration, refer to Chapter 10, *The X Window System* (↑Reference).

13.4 Login Problems

Login problems are those where your machine does, in fact, boot to the expected welcome screen or login prompt, but refuses to accept the username and password or accepts them but then does not behave properly (fails to start the graphic desktop, produces errors, drops to a command line, etc.).

13.4.1 Valid Username and Password Combinations Fail

This usually occurs when the system is configured to use network authentication or directory services and, for some reason, is unable to retrieve results from its configured servers. The `root` user, as the only local user, is the only user that can still log in to these machines. The following are some common reasons why a machine might appear functional but be unable to process logins correctly:

- The network is not working. For further directions on this, turn to [Section 13.5, “Network Problems”](#) (page 220).
- DNS is not working at the moment (which prevents GNOME or KDE from working and the system from making validated requests to secure servers). One indication that this is the case is that the machine takes an extremely long time to respond to any action. Find more information about this topic in [Section 13.5, “Network Problems”](#) (page 220).
- If the system is configured to use Kerberos, the system's local time might have drifted past the accepted variance with the Kerberos server time (this is typically 300 seconds). If NTP (network time protocol) is not working properly or local NTP servers are not working, Kerberos authentication ceases to function because it depends on common clock synchronization across the network.
- The system's authentication configuration is misconfigured. Check the PAM configuration files involved for any typographical errors or misordering of directives. For additional background information about PAM and the syntax of the configuration files involved, refer to Chapter 19, *Authentication with PAM* (↑Reference).
- The home partition is encrypted. Find more information about this topic in [Section 13.4.3, “Login to Encrypted Home Partition Fails”](#) (page 217).

In all cases that do not involve external network problems, the solution is to reboot the system into single-user mode and repair the configuration before booting again into operating mode and attempting to log in again. To boot into single-user mode:

- 1 Reboot the system. The boot screen appears, offering a prompt.
- 2 Enter `1` at the boot prompt to make the system boot into single-user mode.
- 3 Enter the username and password for `root`.
- 4 Make all the necessary changes.
- 5 Boot into the full multiuser and network mode by entering `telinit 5` at the command line.

13.4.2 Valid Username and Password Not Accepted

This is by far the most common problem users encounter, because there are many reasons this can occur. Depending on whether you use local user management and authentication or network authentication, login failures occur for different reasons.

Local user management can fail for the following reasons:

- The user might have entered the wrong password.
- The user's home directory containing the desktop configuration files is corrupted or write protected.
- There might be problems with the X Window System authenticating this particular user, especially if the user's home directory has been used with another Linux distribution prior to installing the current one.

To locate the reason for a local login failure, proceed as follows:

- 1 Check whether the user remembered his password correctly before you start debugging the whole authentication mechanism. If the user might not remember his password correctly, use the YaST User Management module to change the user's password.

- 2 Log in as `root` and check `/var/log/messages` for error messages of the login process and of PAM.
- 3 Try to log in from a console (using `Ctrl + Alt + F1`). If this is successful, the blame cannot be put on PAM, because it is possible to authenticate this user on this machine. Try to locate any problems with the X Window System or the desktop (GNOME or KDE). For more information, refer to [Section 13.4.4, “Login Successful but GNOME Desktop Fails”](#) (page 218) and [Section 13.4.5, “Login Successful but KDE Desktop Fails”](#) (page 219).
- 4 If the user's home directory has been used with another Linux distribution, remove the `Xauthority` file in the user's home. Use a console login via `Ctrl + Alt + F1` and run `rm .Xauthority` as this user. This should eliminate X authentication problems for this user. Try a graphical login again.
- 5 If graphical login still fails, do a console login with `Ctrl + Alt + F1`. Try to start an X session on another display—the first one (`:0`) is already in use:

```
startx -- :1
```

This should bring up a graphical screen and your desktop. If it does not, check the log files of the X Window System (`/var/log/Xorg.displaynumber.log`) or the log file for your desktop applications (`.xsession-errors` in the user's home directory) for any irregularities.
- 6 If the desktop could not start because of corrupt configuration files, proceed with [Section 13.4.4, “Login Successful but GNOME Desktop Fails”](#) (page 218) or [Section 13.4.5, “Login Successful but KDE Desktop Fails”](#) (page 219).

The following are some common reasons why network authentication for a particular user might fail on a specific machine:

- The user might have entered the wrong password.
- The username exists in the machine's local authentication files and is also provided by a network authentication system, causing conflicts.
- The home directory exists but is corrupt or unavailable. Perhaps it is write protected or is on a server that is inaccessible at the moment.

- The user does not have permission to log in to that particular host in the authentication system.
- The machine has changed hostnames, for whatever reason, and the user does not have permission to log in to that host.
- The machine cannot reach the authentication server or directory server that contains that user's information.
- There might be problems with the X Window System authenticating this particular user, especially if the user's home has been used with another Linux distribution prior to installing the current one.

To locate the cause of the login failures with network authentication, proceed as follows:

- 1** Check whether the user remembered his password correctly before you start debugging the whole authentication mechanism.
- 2** Determine the directory server the machine relies on for authentication and make sure that it is up and running and properly communicating with the other machines.
- 3** Determine that the user's username and password work on other machines to make sure that his authentication data exists and is properly distributed.
- 4** See if another user can log in to the misbehaving machine. If another user can log in without difficulty or if `root` can log in, log in and examine the `/var/log/messages` file. Locate the time stamps that correspond to the login attempts and determine if PAM has produced any error messages.
- 5** Try to log in from a console (using `Ctrl + Alt + F1`). If this is successful, the blame cannot be put on PAM or the directory server on which the user's home is hosted, because it is possible to authenticate this user on this machine. Try to locate any problems with the X Window System or the desktop (GNOME or KDE). For more information, refer to [Section 13.4.4, “Login Successful but GNOME Desktop Fails”](#) (page 218) and [Section 13.4.5, “Login Successful but KDE Desktop Fails”](#) (page 219).
- 6** If the user's home directory has been used with another Linux distribution, remove the `Xauthority` file in the user's home. Use a console login via `Ctrl + Alt + F1` and run `rm .Xauthority` as this user. This should eliminate X authentication problems for this user. Try a graphical login again.

- 7 If graphical login still fails, do a console login with `Ctrl + Alt + F1`. Try to start an X session on another display—the first one (`:0`) is already in use:

```
startx -- :1
```

This should bring up a graphical screen and your desktop. If it does not, check the log files of the X Window System (`/var/log/Xorg.displaynumber.log`) or the log file for your desktop applications (`.xsession-errors` in the user's home directory) for any irregularities.

- 8 If the desktop could not start because of corrupt configuration files, proceed with [Section 13.4.4, “Login Successful but GNOME Desktop Fails”](#) (page 218) or [Section 13.4.5, “Login Successful but KDE Desktop Fails”](#) (page 219).

13.4.3 Login to Encrypted Home Partition Fails

It is recommended to use an encrypted home partition for laptops. If you cannot log in to your laptop, the reason is usually simple: your partition could not be unlocked.

During boot time you have to enter the passphrase to unlock your encrypted partition. If you do not enter it, the boot process continues, leaving the partition locked.

To unlock your encrypted partition, proceed as follows:

- 1 Switch to the text console with `Ctrl + Alt + F1`.
- 2 Become `root`.
- 3 Restart the unlocking process again with:

```
/etc/init.d/boot.crypto restart
```
- 4 Enter your passphrase to unlock your encrypted partition.
- 5 Exit the text console and switch back to the login screen with `Alt + F7`.
- 6 Log in as usual.

13.4.4 Login Successful but GNOME Desktop Fails

If this is true for a particular user, it is likely that the user's GNOME configuration files have become corrupted. Some symptoms might include the keyboard failing to work, the screen geometry becoming distorted, or even the screen coming up as a bare gray field. The important distinction is that if another user logs in, the machine works normally. If this is the case, it is likely that the problem can be fixed relatively quickly by simply moving the user's GNOME configuration directory to a new location, which causes GNOME to initialize a new one. Although the user is forced to reconfigure GNOME, no data is lost.

- 1 Switch to a text console by pressing **Ctrl + Alt + F1**.
- 2 Log in with your user name.
- 3 Move the user's GNOME configuration directories to a temporary location:

```
mv .gconf .gconf-ORIG-RECOVER
mv .gnome2 .gnome2-ORIG-RECOVER
```

- 4 Log out.
- 5 Log in again, but do not run any applications.
- 6 Recover your individual application configuration data (including the Evolution e-mail client data) by copying the `~/ .gconf-ORIG-RECOVER/apps/` directory back into the new `~/ .gconf` directory as follows:

```
cp -a .gconf-ORIG-RECOVER/apps .gconf/
```

If this causes the login problems, attempt to recover only the critical application data and reconfigure the remainder of the applications.

13.4.5 Login Successful but KDE Desktop Fails

There are several reasons why a KDE desktop would not allow users to login. Corrupted cache data can cause login problems as well as corrupt KDE desktop configuration files.

Cache data is used at desktop start-up to increase performance. If this data is corrupted, start-up is slowed down or fails entirely. Removing them forces the desktop start-up routines to start from scratch. This takes more time than a normal start-up, but data is intact after this and the user can login.

To remove the cache files of the KDE desktop, issue the following command as `root`:

```
rm -rf /tmp/kde-user /tmp/socket-user
```

Replace `user` with the actual username. Removing these two directories just removes the corrupted cache files. No real data is harmed using this procedure.

Corrupted desktop configuration files can always be replaced with the initial configuration files. If you want to recover the user's adjustments, carefully copy them back from their temporary location after the configuration has been restored using the default configuration values.

To replace a corrupted desktop configuration with the initial configuration values, proceed as follows:

- 1 Switch to a text console by pressing `Ctrl + Alt + F1`.
- 2 Log in with your user name.
- 3 Move the KDE configuration directory and the `.skel` files to a temporary location:

- For KDE3 use this command:

```
mv .kde .kde-ORIG-RECOVER
mv .skel .skel-ORIG-RECOVER
```

- For KDE4 use this command:

```
mv .kde4 .kde4-ORIG-RECOVER
mv .skel .skel-ORIG-RECOVER
```

4 Log out.

5 Log in again.

6 After the desktop has started successfully, copy the user's own configurations back into place:

```
cp -a KDEDIR/share .kde/share
```

Replace *KDEDIR* with the directory from [Step 3](#) (page 219).

IMPORTANT

If the user's own adjustments caused the login to fail and continue to do so, repeat the procedure as described above, but do not copy the `.kde/share` directory.

13.5 Network Problems

Many problems of your system may be network-related, even though they do not seem to be at first. For example, the reason for a system not allowing users to log in might be a network problem of some kind. This section introduces a simple check list you can apply to identify the cause of any network problem encountered.

When checking the network connection of your machine, proceed as follows:

- 1** If using an ethernet connection, check the hardware first. Make sure that your network cable is properly plugged into your computer. The control lights next to your ethernet connector, if available, should both be active.

If the connection fails, check whether your network cable works with another machine. If it does, your network card causes the failure. If hubs or switches are included in your network setup, suspect them to be the culprits as well.

- 2 If using a wireless connection, check whether the wireless link can be established by other machines. If this is not the case, contact the wireless network's administrator.
- 3 Once you have checked your basic network connectivity, try to find out which service is not responding. Gather the address information of all network servers needed in your setup. Either look them up in the appropriate YaST module or ask your system administrator. The following list gives some of the typical network servers involved in a setup together with the symptoms of an outage.

DNS (Name Service)

A broken or malfunctioning name service affects the network's functioning in many ways. If the local machine relies on any network servers for authentication and these servers cannot be found due to name resolution issues, users would not even be able to log in. Machines in the network managed by a broken name server would not be able to “see” each other and communicate.

NTP (Time Service)

A malfunctioning or completely broken NTP service could affect Kerberos authentication and X server functionality.

NFS (File Service)

If any application needed data stored in an NFS mounted directory, it would not be able to start or function properly if this service was down or misconfigured. In a worst case scenario, a user's personal desktop configuration would not come up if his home directory containing the `.gconf` or `.kde` subdirectories could not be found due to an outage of the NFS server.

Samba (File Service)

If any application needed data stored in a directory on a Samba server, it would not be able to start or function properly if this service was down.

NIS (User Management)

If your openSUSE system relied on a NIS server to provide the user data, users would not be able to log in to this machine if the NIS service was down.

LDAP (User Management)

If your openSUSE system relied on an LDAP server to provide the user data, users would not be able to log in to this machine if the LDAP service was down.

Kerberos (Authentication)

Authentication would not work and login to any machine would fail.

CUPS (Network Printing)

Users would not be able to print.

- 4 Check whether the network servers are running and whether your network setup allows you to establish a connection:

IMPORTANT

The debugging procedure described below only applies to a simple network server/client setup that does not involve any internal routing. It assumes both server and client are members of the same subnet without the need for additional routing.

- 4a Use `ping hostname` (replace *hostname* with the hostname of the server) to check whether each one of them is up and responding to the network. If this command is successful, it tells you that the host you were looking for is up and running and that the name service for your network is configured correctly.

If `ping` fails with `destination host unreachable`, either your system or the desired server is not properly configured or down. Check whether your system is reachable by running `ping your_hostname` from another machine. If you can reach your machine from another machine, it is the server that is not running at all or not configured correctly.

If `ping` fails with `unknown host`, the name service is not configured correctly or the hostname used was incorrect. Use `ping -n ipaddress` to try to connect to this host without name service. If this is successful, check the spelling of the hostname and for a misconfigured name service in your network. For further checks on this matter, refer to [Step 4b](#) (page 222). If `ping` still fails, either your network card is not configured correctly or your network hardware is faulty.

- 4b Use `host hostname` to check whether the hostname of the server you are trying to connect to is properly translated into an IP address and vice versa. If this command returns the IP address of this host, the name service

is up and running. If the `host` command fails, check all network configuration files relating to name and address resolution on your host:

```
/etc/resolv.conf
```

This file is used to keep track of the name server and domain you are currently using. It can be modified manually or automatically adjusted by YaST or DHCP. Automatic adjustment is preferable. However, make sure that this file has the following structure and all network addresses and domain names are correct:

```
search fully_qualified_domain_name
nameserver ipaddress_of_nameserver
```

This file can contain more than one name server address, but at least one of them must be correct to provide name resolution to your host. If needed, adjust this file using the YaST DNS and Hostname module.

If your network connection is handled via DHCP, enable DHCP to change hostname and name service information by selecting *Change Hostname via DHCP* and *Update Name Servers and Search List via DHCP* in the YaST DNS and Hostname module.

```
/etc/nsswitch.conf
```

This file tells Linux where to look for name service information. It should look like this:

```
...
hosts: files dns
networks: files dns
...
```

The `dns` entry is vital. It tells Linux to use an external name server. Normally, these entries are automatically made by YaST, but it never hurts to check.

If all the relevant entries on the host are correct, let your system administrator check the DNS server configuration for the correct zone information. For detailed information about DNS, refer to Chapter 22, *The Domain Name System* (↑Reference). If you have made sure that the DNS configuration of your host and the DNS server are correct, proceed with checking the configuration of your network and network device.

- 4c** If your system cannot establish a connection to a network server and you have excluded name service problems from the list of possible culprits, check the configuration of your network card.

Use the command `ifconfig network_device` (executed as `root`) to check whether this device was properly configured. Make sure that both `inet address` and `Mask` are configured correctly. An error in the IP address or a missing bit in your network mask would render your network configuration unusable. If necessary, perform this check on the server as well.

- 4d** If the name service and network hardware are properly configured and running, but some external network connections still get long time-outs or fail entirely, use `traceroute fully_qualified_domain_name` (executed as `root`) to track the network route these requests are taking. This command lists any gateway (hop) a request from your machine passes on its way to its destination. It lists the response time of each hop and whether this hop is reachable at all. Use a combination of `traceroute` and `ping` to track down the culprit and let the administrators know.

Once you have identified the cause of your network trouble, you can resolve it yourself (if the problem is located on your machine) or let the system administrators of your network know about your findings so they can reconfigure the services or repair the necessary systems.

13.5.1 NetworkManager Problems

If you have a problem with network connectivity, narrow it down as described in (page 220). If NetworkManager seems to be the culprit, proceed as follows to get logs providing hints on why NetworkManager fails:

- 1 Open a shell and log in as `root`.
- 2 Restart the NetworkManager:

```
rcnetwork restart -o nm
```

- 3 Open a web page, for example, <http://www.opensuse.org> as normal user to see, if you can connect.
- 4 Collect any information about the state of NetworkManager in `/var/log/NetworkManager`.

For more information about NetworkManager, refer to [Chapter 10, Using NetworkManager](#) (page 153).

13.6 Data Problems

Data problems are when the machine might or might not boot properly but, in either case, it is clear that there is data corruption on the system and that the system needs to be recovered. These situations call for a backup of your critical data, enabling you to recover a system state from before your system failed. openSUSE offers dedicated YaST modules for system backup and restoration as well as a rescue system that can be used to recover a corrupted system from the outside.

13.6.1 Backing Up Critical Data

System backups can be easily managed using the YaST System Backup module:

- 1 As `root`, start YaST and select *System > System Backup*.
- 2 Create a backup profile holding all details needed for the backup, filename of the archive file, scope, and type of the backup:
 - 2a Select *Profile Management > Add*.
 - 2b Enter a name for the archive.
 - 2c Enter the path to the location of the backup if you want to keep a local backup. For your backup to be archived on a network server (via NFS), enter the IP address or name of the server and the directory that should hold your archive.
 - 2d Determine the archive type and click *Next*.

- 2e** Determine the backup options to use, such as whether files not belonging to any package should be backed up and whether a list of files should be displayed prior to creating the archive. Also determine whether changed files should be identified using the time-consuming MD5 mechanism.

Use *Expert* to enter a dialog for the backup of entire hard disk areas. Currently, this option only applies to the Ext2 file system.

- 2f** Finally, set the search constraints to exclude certain system areas from the backup area that do not need to be backed up, such as lock files or cache files. Add, edit, or delete items until your needs are met and leave with *OK*.

- 3** Once you have finished the profile settings, you can start the backup right away with *Create Backup* or configure automatic backup. It is also possible to create other profiles tailored for various other purposes.

To configure automatic backup for a given profile, proceed as follows:

- 1** Select *Automatic Backup* from the *Profile Management* menu.
- 2** Select *Start Backup Automatically*.
- 3** Determine the backup frequency. Choose *daily*, *weekly*, or *monthly*.
- 4** Determine the backup start time. These settings depend on the backup frequency selected.
- 5** Decide whether to keep old backups and how many should be kept. To receive an automatically generated status message of the backup process, check *Send Summary Mail to User root*.
- 6** Click *OK* to apply your settings and have the first backup start at the time specified.

13.6.2 Restoring a System Backup

Use the YaST System Restoration module to restore the system configuration from a backup. Restore the entire backup or select specific components that were corrupted and need to be reset to their old state.

- 1 Start *YaST* > *System* > *System Restoration*.
- 2 Enter the location of the backup file. This could be a local file, a network mounted file, or a file on a removable device, such as a floppy or a DVD. Then click *Next*.

The following dialog displays a summary of the archive properties, such as the filename, date of creation, type of backup, and optional comments.

- 3 Review the archived content by clicking *Archive Content*. Clicking *OK* returns you to the *Archive Properties* dialog.
- 4 *Expert Options* opens a dialog in which to fine-tune the restore process. Return to the *Archive Properties* dialog by clicking *OK*.
- 5 Click *Next* to open the view of packages to restore. Press *Accept* to restore all files in the archive or use the various *Select All*, *Deselect All*, and *Select Files* buttons to fine-tune your selection. Only use the *Restore RPM Database* option if the RPM database is corrupted or deleted and this file is included in the backup.
- 6 After you click *Accept*, the backup is restored. Click *Finish* to leave the module after the restore process is completed.

13.6.3 Recovering a Corrupted System

There are several reasons why a system could fail to come up and run properly. A corrupted file system after a system crash, corrupted configuration files, or a corrupted boot loader configuration are the most common ones.

openSUSE offers two different methods to cope with these situations. You can either use the YaST System Repair functionality or boot the rescue system. The following sections cover both flavors of system repair.

Using YaST System Repair

NOTE: Keyboard and Language Settings

If you change the language settings after booting, your keyboard is adapted as well.

Before launching the YaST System Repair module, determine in which mode to run it to best fit your needs. Depending on the severeness and cause of your system failure and your expertise, there are three different modes to choose from:

Automatic Repair

If your system failed due to an unknown cause and you basically do not know which part of the system is to blame for the failure, use *Automatic Repair*. An extensive automated check will be performed on all components of your installed system. For a detailed description of this procedure, refer to [Section “Automatic Repair”](#) (page 228).

Customized Repair

If your system failed and you already know which component is to blame, you can cut the lengthy system check with *Automatic Repair* short by limiting the scope of the system analysis to those components. For example, if the system messages prior to the failure seem to indicate an error with the package database, you can limit the analysis and repair procedure to checking and restoring this aspect of your system. For a detailed description of this procedure, refer to [Section “Customized Repair”](#) (page 230).

Expert Tools

If you already have a clear idea of what component failed and how this should be fixed, you can skip the analysis runs and directly apply the tools necessary for the repair of the respective component. For details, refer to [Section “Expert Tools”](#) (page 231).

Choose one of the repair modes as described above and proceed with the system repair as outlined in the following sections.

Automatic Repair

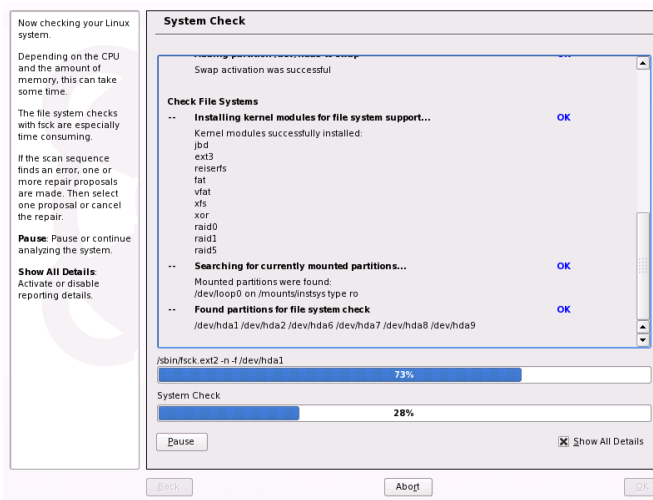

To start the automatic repair mode of YaST System Repair, proceed as follows:

- 1 Insert the installation medium of openSUSE into your DVD drive.
- 2 Reboot the system.
- 3 On the boot screen, select *Repair Installed System*.
- 4 Confirm the license agreement and click *Next*.

5 Select *Automatic Repair*.

YaST now launches an extensive analysis of the installed system. The progress of the procedure is displayed at the bottom of the screen with two progress bars. The upper bar shows the progress of the currently running test. The lower bar shows the overall progress of the analysis. The log window in the top section tracks the currently running test and its result. See [Figure 13.2, “Automatic Repair Mode”](#) (page 229). The following main test runs are performed with every run. They contain, in turn, a number of individual subtests.

Figure 13.2 *Automatic Repair Mode*

Check Partition Tables

Checks the validity and coherence of the partition tables of all detected hard disks.

Check Swap Areas

The swap partitions of the installed system are detected, tested, and offered for activation where applicable. This offer should be accepted for the sake of a higher system repair speed.

Check File Systems

All detected file systems are subjected to a file system–specific check.

Check fstab Entries

The entries in the file are checked for completeness and consistency. All valid partitions are mounted.

Check Package Database

This checks whether all packages necessary for the operation of a minimal installation are present. While it is optionally possible also to analyze the base packages, this takes a long time because of their vast number.

Check Boot Loader Configuration

The boot loader configuration of the installed system (GRUB or LILO) is checked for completeness and coherence. Boot and root devices are examined and the availability of the initrd modules is checked.

- 6 Whenever an error is encountered, the procedure stops and a dialog opens outlining the details and possible solutions.

Read the screen messages carefully before accepting the proposed fix. If you decide to decline a proposed solution, your system remains unchanged.

- 7 After the repair process has been terminated successfully, click *OK* and *Finish* and remove the installation media. The system automatically reboots.

Customized Repair

To launch the *Customized Repair* mode and selectively check certain components of your installed system, proceed as follows:

- 1 Insert the installation medium of openSUSE into your DVD drive.
- 2 Reboot the system.
- 3 At the boot screen, select *Repair Installed System*.
- 4 Confirm the license agreement and click *Next*.
- 5 Select *Customized Repair*.

Choosing *Customized Repair* shows a list of test runs that are all marked for execution at first. The total range of tests matches that of automatic repair. If you already know where no damage is present, unmark the corresponding tests.

Clicking *Next* starts a narrower test procedure that probably has a significantly shorter running time.

Not all test groups can be applied individually. The analysis of the `fstab` entries is always bound to an examination of the file systems, including existing swap partitions. YaST automatically resolves such dependencies by selecting the smallest number of necessary test runs.

- 6 Whenever an error is encountered, the procedure stops and a dialog opens outlining the details and possible solutions.

Read the screen messages carefully before accepting the proposed fix. If you decide to decline a proposed solution, your system remains unchanged.

- 7 After the repair process has been terminated successfully, click *OK* and *Finish* and remove the installation media. The system automatically reboots.

Expert Tools

If you are knowledgeable with openSUSE and already have a very clear idea of what needs to be repaired in your system, directly apply the tools skipping the system analysis.

To make use of the *Expert Tools* feature of the YaST System Repair module, proceed as follows:

- 1 Insert the installation medium of openSUSE into your DVD drive.
- 2 Reboot the system.
- 3 At the boot screen, select *Repair Installed System*.
- 4 Confirm the license agreement and click *Next*.
- 5 Select *Expert Tools* and choose a repair option.
- 6 After the repair process has been terminated successfully, click *OK* and *Finish* and remove the installation media. The system automatically reboots.

The *Expert Tools* provides the following options to repair your faulty system:

Install New Boot Loader

This starts the YaST boot loader configuration module. Find details in Section “Configuring the Boot Loader with YaST” (Chapter 15, *The Boot Loader*, ↑Reference).

Start Partitioning Tool

This starts the expert partitioning tool in YaST.

Repair File System

This checks the file systems of your installed system. You are first offered a selection of all detected partitions and can then choose the ones to check.

Recover Lost Partitions

It is possible to attempt to reconstruct damaged partition tables. A list of detected hard disks is presented first for selection. Clicking *OK* starts the examination. This can take a while depending on the processing power and size of the hard disk.

IMPORTANT: *Reconstructing a Partition Table*

The reconstruction of a partition table is tricky. YaST attempts to recognize lost partitions by analyzing the data sectors of the hard disk. The lost partitions are added to the rebuilt partition table when recognized. This is, however, not successful in all imaginable cases.

Save System Settings to Floppy

This option saves important system files to a floppy disk. If one of these files becomes damaged, it can be restored from disk.

Verify Installed Software

This checks the consistency of the package database and the availability of the most important packages. Any damaged installed packages can be reinstalled with this tool.

Using the Rescue System

openSUSE contains a rescue system. The rescue system is a small Linux system that can be loaded into a RAM disk and mounted as root file system, allowing you to access your Linux partitions from the outside. Using the rescue system, you can recover or modify any important aspect of your system:

- Manipulate any type of configuration file.

- Check the file system for defects and start automatic repair processes.
- Access the installed system in a “change root” environment.
- Check, modify, and reinstall the boot loader configuration.
- Resize partitions using the parted command. Find more information about this tool at the Web site of GNU Parted (<http://www.gnu.org/software/parted/parted.html>).

The rescue system can be loaded from various sources and locations. The simplest option is to boot the rescue system from the original installation medium:

- 1** Insert the installation medium into your DVD drive.
- 2** Reboot the system.
- 3** At the boot screen, press F4 and choose *DVD-ROM*. Then choose *Rescue System* from the main menu.
- 4** Enter `root` at the `Rescue :` prompt. A password is not required.

If your hardware setup does not include a DVD drive, you can boot the rescue system from a network source (including the openSUSE FTP server). The following example applies to a remote boot scenario—if using another boot medium, such as a DVD, modify the `info` file accordingly and boot as you would for a normal installation.

- 1** Enter the configuration of your PXE boot setup and add the lines `install=protocol://instsource` and `rescue=1`. If you need to start the repair system, use `repair=1` instead. As with a normal installation, `protocol` stands for any of the supported network protocols (NFS, HTTP, FTP, etc.) and `instsource` for the path to your network installation source.
- 2** Boot the system using “Wake on LAN”, as described in Section “Wake on LAN” (Chapter 1, *Remote Installation*, ↑Reference).
- 3** Enter `root` at the `Rescue :` prompt. A password is not required.

Once you have entered the rescue system, you can make use of the virtual consoles that can be reached with Alt + F1 to Alt + F6.

A shell and many other useful utilities, such as the `mount` program, are available in the `/bin` directory. The `sbin` directory contains important file and network utilities for reviewing and repairing the file system. This directory also contains the most important binaries for system maintenance, such as `fdisk`, `mkfs`, `mkswap`, `mount`, `init`, and `shutdown`, and `ifconfig`, `ip`, `route`, and `netstat` for maintaining the network. The directory `/usr/bin` contains the `vi` editor, `find`, `less`, and `ssh`.

To see the system messages, either use the command `dmesg` or view the file `/var/log/messages`.

Checking and Manipulating Configuration Files

As an example for a configuration that might be fixed using the rescue system, imagine you have a broken configuration file that prevents the system from booting properly. You can fix this using the rescue system.

To manipulate a configuration file, proceed as follows:

- 1 Start the rescue system using one of the methods described above.
- 2 To mount a root file system located under `/dev/sda6` to the rescue system, use the following command:

```
mount /dev/sda6 /mnt
```

All directories of the system are now located under `/mnt`.

- 3 Change the directory to the mounted root file system:

```
cd /mnt
```

- 4 Open the problematic configuration file in the `vi` editor. Adjust and save the configuration.

- 5 Unmount the root file system from the rescue system:

```
umount /mnt
```

- 6 Reboot the machine.

Repairing and Checking File Systems

Generally, file systems cannot be repaired on a running system. If you encounter serious problems, you may not even be able to mount your root file system and the system boot may end with a “kernel panic”. In this case, the only way is to repair the system from the outside. It is strongly recommended to use the YaST System Repair for this task (see [Section “Using YaST System Repair”](#) (page 227) for details). However, if you need to do a manual file system check or repair, boot the rescue system. It contains the utilities to check and repair the `ext2`, `ext3`, `reiserfs`, `xfs`, `dosfs`, and `vfat` file systems.

Accessing the Installed System

If you need to access the installed system from the rescue system to, for example, modify the boot loader configuration, or to execute a hardware configuration utility, you need to do this in a “change root” environment.

To set up a “change root” environment based on the installed system, proceed as follows:

- 1 First mount the root partition from the installed system and the device file system:

```
mount /dev/sda6 /mnt
mount --bind /dev /mnt/dev
```

- 2 Now you can “change root” into the new environment:

```
chroot /mnt
```

- 3 Then mount `/proc` and `/sys`:

```
mount /proc
mount /sys
```

- 4 Finally, mount the remaining partitions from the installed system:

```
mount -a
```

- 5 Now you have access to the installed system. Before rebooting the system, unmount the partitions with `umount -a` and leave the “change root” environment with `exit`.

WARNING: Limitations

Although you have full access to the files and applications of the installed system, there are some limitations. The kernel that is running is the one that was booted with the rescue system. It only supports essential hardware and it is not possible to add kernel modules from the installed system unless the kernel versions are exactly the same (which is unlikely). So you cannot access a sound card, for example. It is also not possible to start a graphical user interface.

Also note that you leave the “change root” environment when you switch the console with Alt + F1 to Alt + F6.

Modifying and Reinstalling the Boot Loader

Sometimes a system cannot boot because the boot loader configuration is corrupted. The start-up routines cannot, for example, translate physical drives to the actual locations in the Linux file system without a working boot loader.

To check the boot loader configuration and reinstall the boot loader, proceed as follows:

- 1 Perform the necessary steps to access the installed system as described in [Section “Accessing the Installed System”](#) (page 235).
- 2 Check whether the following files are correctly configured according to the GRUB configuration principles outlined in Chapter 15, *The Boot Loader* (↑Reference).

- `/etc/grub.conf`
- `/boot/grub/device.map`
- `/boot/grub/menu.lst`

Apply fixes to the device mapping (`device.map`) or the location of the root partition and configuration files, if necessary.

- 3 Reinstall the boot loader using the following command sequence:

```
grub --batch < /etc/grub.conf
```

- 4 Unmount the partitions, log out from the “change root” environment, and reboot the system:

```
umount -a  
exit  
reboot
```

GNU Licenses

This appendix contains the GNU General Public License and the GNU Free Documentation License.

GNU General Public License

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc. 59 Temple Place - Suite 330, Boston, MA 02111-1307, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The “Program”, below, refers to any such program or work, and a “work based on the Program” means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term “modification”.) Each licensee is addressed as “you”.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program’s source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

one line to give the program's name and an idea of what it does. Copyright (C) yyyy name of author

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place - Suite 330, Boston, MA 02111-1307, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details
type `show w'. This is free software, and you are welcome
to redistribute it under certain conditions; type `show c'
for details.
```

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright
interest in the program `Gnomovision'
(which makes passes at compilers) written
by James Hacker.
```

```
signature of Ty Coon, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License [<http://www.fsf.org/licenses/lgpl.html>] instead of this License.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

PREAMBLE

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The “Document”, below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as “you”. You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A “Modified Version” of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A “Secondary Section” is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document’s overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The “Invariant Sections” are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The “Cover Texts” are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A “Transparent” copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not “Transparent” is called “Opaque”.

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The “Title Page” means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, “Title Page” means the text near the most prominent appearance of the work’s title, preceding the beginning of the body of the text.

A section “Entitled XYZ” means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as “Acknowledgements”, “Dedications”, “Endorsements”, or “History”.) To “Preserve the Title” of such a section when you modify the Document means that it remains a section “Entitled XYZ” according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document’s license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
- B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
- C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
- D. Preserve all the copyright notices of the Document.
- E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
- G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
- H. Include an unaltered copy of this License.
- I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
- J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
- K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
- L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
- M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
- N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
- O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties--for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled “History” in the various original documents, forming one section Entitled “History”; likewise combine any sections Entitled “Acknowledgements”, and any sections Entitled “Dedications”. You must delete all sections Entitled “Endorsements”.

COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an “aggregate” if the copyright resulting from the compilation is not used to limit the legal rights of the compilation’s users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document’s Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled “Acknowledgements”, “Dedications”, or “History”, the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License “or any later version” applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright (c) YEAR YOUR NAME.

Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 only as published by the Free Software Foundation; with the Invariant Section being this copyright notice and license. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the "with...Texts." line with this:

with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
